WRITING SAMPLE · ARRAYTICS

Eventin 4.0 Is Here: What Changed and Why

Product: Eventin **Type:** Release notes **Year:** 2024 **Written by:** Iftekhar Ahmed (Samir)

Length: 4,227 words

Release documentation for a ground-up rebuild: page-by-page UI and UX changes, API and caching improvements, unit testing, optimisations and bug fixes, with a recap of every change.

Conditions of use

Ownership	Written by Iftekhar Ahmed while working at Arraytics. The text, product names, screenshots, logos and trademarks belong to Arraytics, which keeps all rights to them.
Purpose	Shared only to show writing work to potential employers and clients for review.
Edits	Internal notes, designer briefs, reference images and editorial comments were removed. No confidential data, credentials or customer information is included. The text is the writer's own draft and may differ from any version Arraytics published.
Not official	This is not an official Arraytics publication. Product details describe the plugin at the time of writing and may be out of date.
No reuse	Do not copy, republish, distribute or use any part of this document without written permission from Arraytics.

Introduction

Hey, event manager!

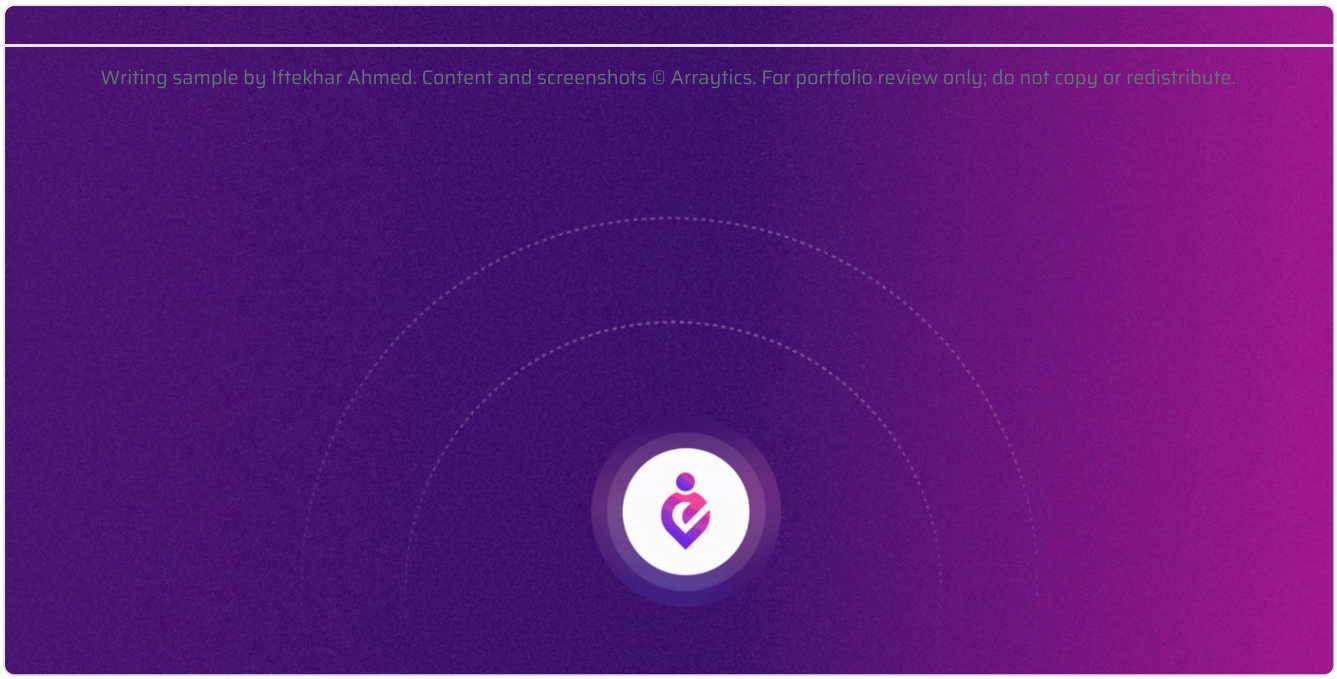

Do you dream of a smoother, smarter way to streamline your event creation, registration, and attendee experience? Well, no more!

We're thrilled to announce the much-anticipated arrival of Eventin 4.0 – a groundbreaking update packed with innovations that will transform the way you manage events on your WordPress website.

Meet Eventin 4.0: A Game-Changer for Event Organizers

For years, Eventin has been empowering WordPress users to create and manage stunning events.

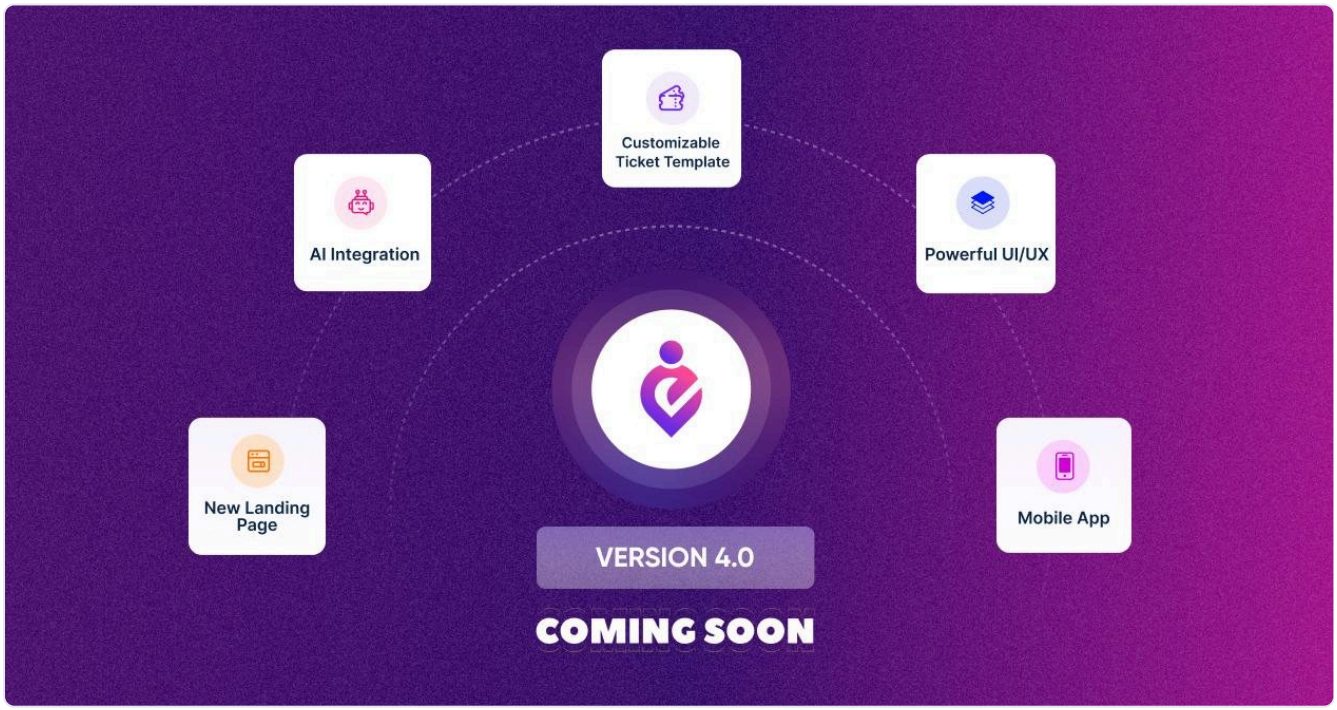

Writing sample by Iftekhar Ahmed. Content and screenshots © Arraytics. For portfolio review only; do not copy or redistribute.

Now, with version 4.0, we're taking things to the next level. Here's a sneak peek at the key improvements and exciting new features that await you:

What's New in Eventin 4.0?

Now that we know that Eventin 4.0 has arrived with a lot of changes on the list, let's take a look at the mind-blowing features and changes Eventin 4.0 has brought for you:

Improvement-01: Stunning UI/UX

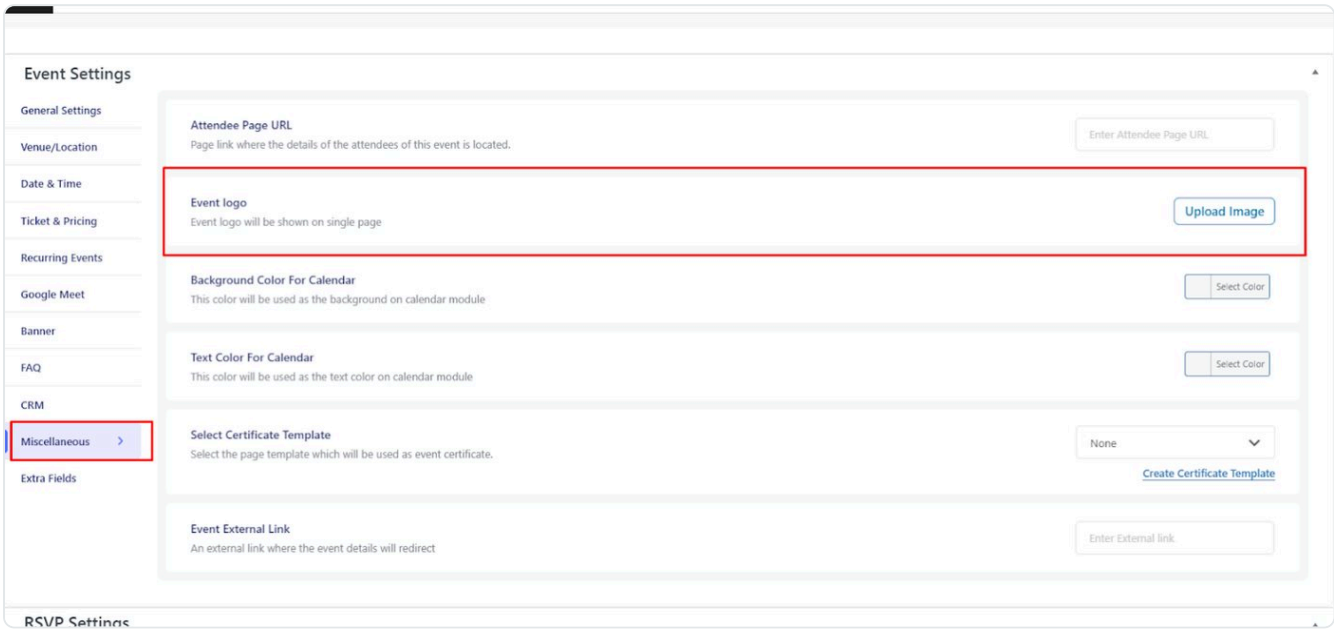

Did you know that 73% of event organizers find event management software with a user-friendly interface crucial for their workflow?

Not just a brush up, Eventin 4.0 has brought a fresh-new stunning look designed for intuitive navigation and effortless event management. This new user interface (UI) will be easier to understand, and faster to navigate on the website.

Writing sample by Mekhail Ahmed. Content and screenshots © Arraytics. For portfolio review only, do not copy or redistribute.

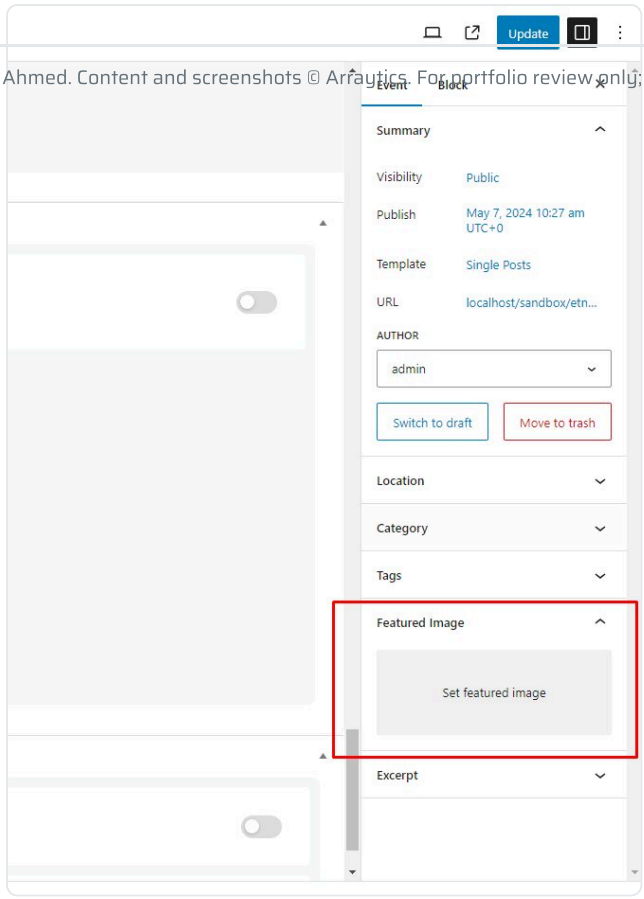

Even now, all the elements are place with quite relevance to your tailored needs with a data-backed research. Let's see the massive change that will shift the way you manage your events:

Let's start with Your **Event Branding**.

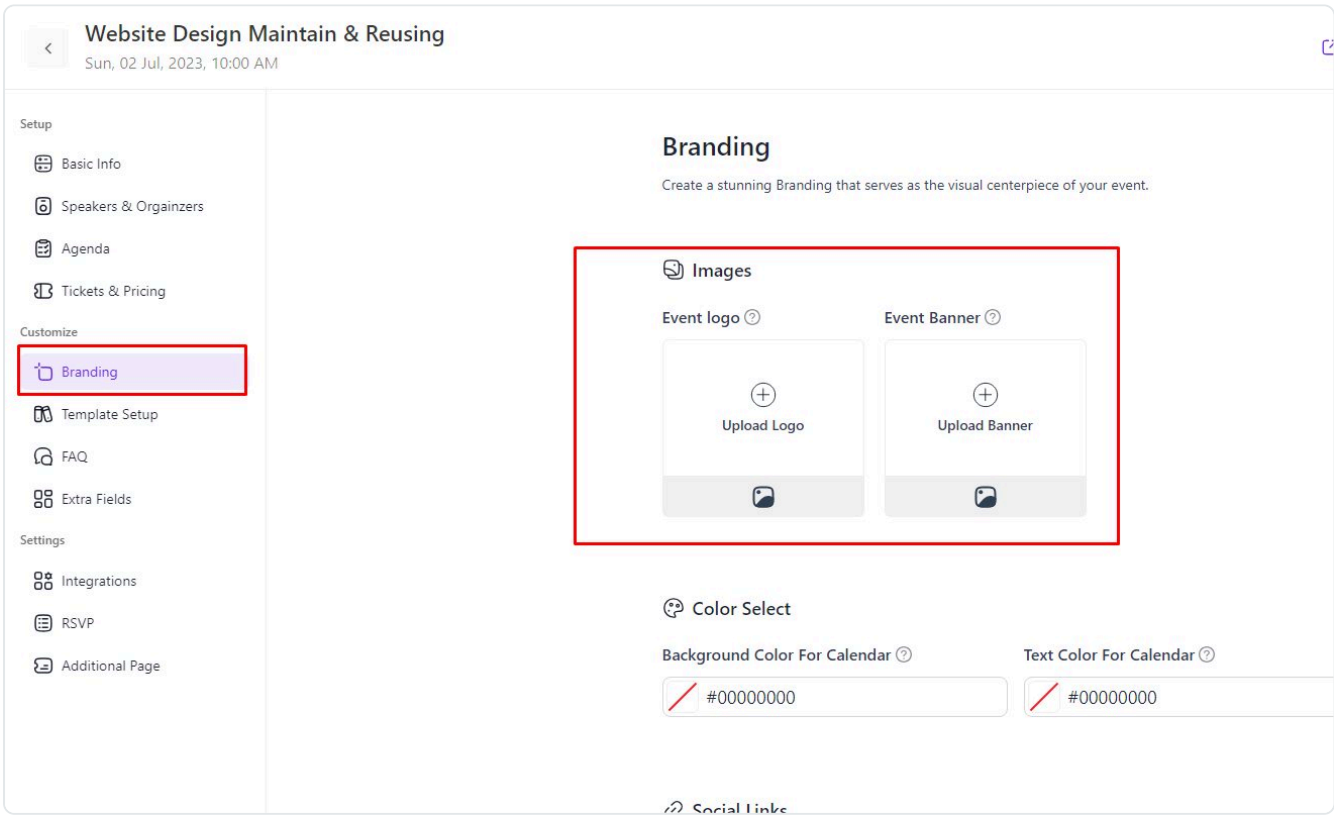

Back in those days, you could upload your event logo on the miscellaneous section, which was a bit far from home.

Writing sample by Iftekhar Ahmed. Content and screenshots © Arraytics. For portfolio review only; do not copy or redistribute.

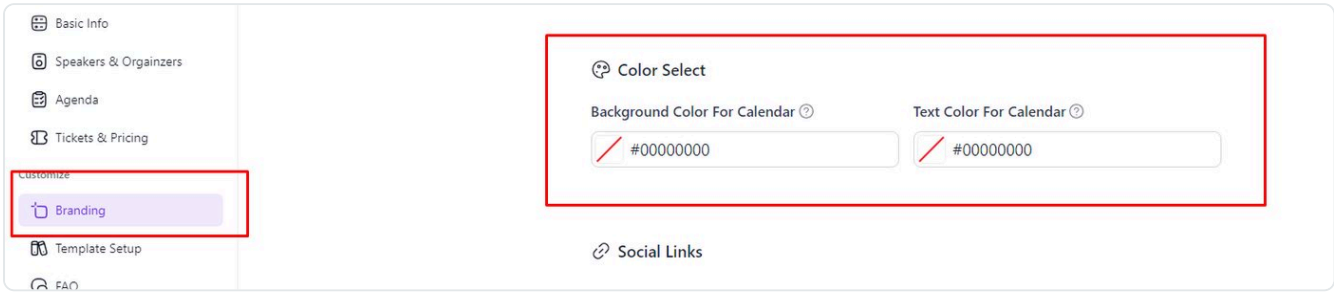

But we've wanted to take off the stress – so we decided to put all things **related to branding** in one section, obviously named "The Branding Section". It's where you can upload both **event logo** and **event banner** side by side.

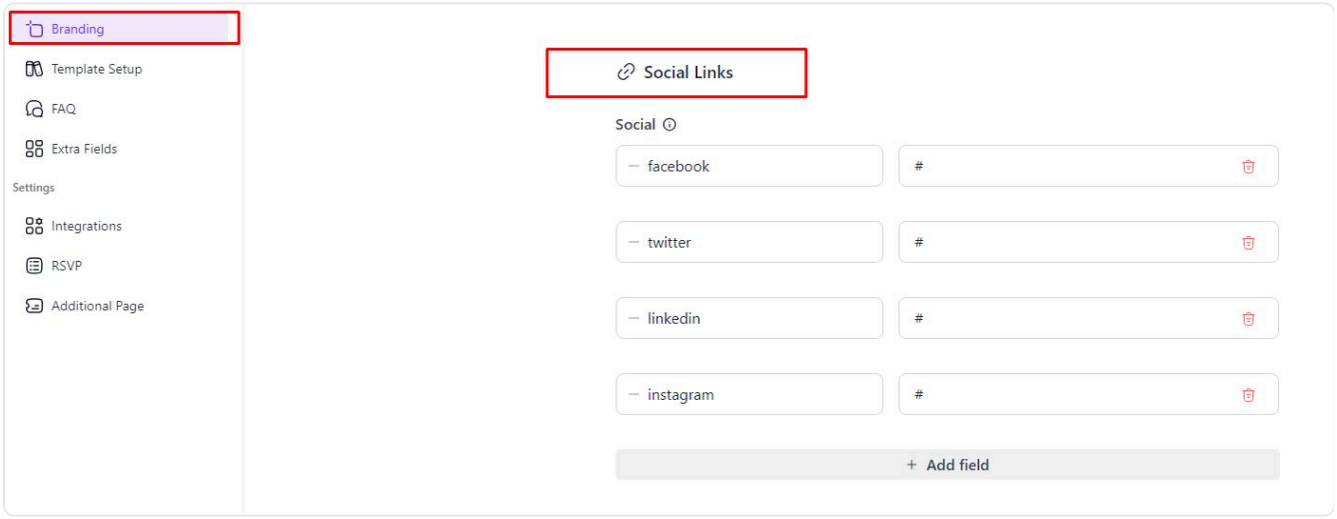

As this section works on your **event branding**, we've put added colors, social links and more in one bucket. Writing sample by Iftekhar Ahmed. Content and screenshots © Arraytics. For portfolio review only; do not copy or redistribute.

Sound easy to find, right? That's not all.

Now that you have designed your event branding, now it's time to work on the **calendar color, design texts –** to craft event branding details.

Even you can add the social icons on the event details to connect your socials on upcoming events. In the previous version, the social links were in the general settings, now it's all here in the branding section.

The purpose is to just gather around all the **brand-related elements** that you need to create an event faster – into the **branding section on Eventin 4.0**. So, you have in there:

- Event logo & Event banner
- Calendar color, text color in the calendar
- Social icons and links

Now that you have everything you need for event branding, let's move on to selecting the **event templates**.

Template Setup Page:

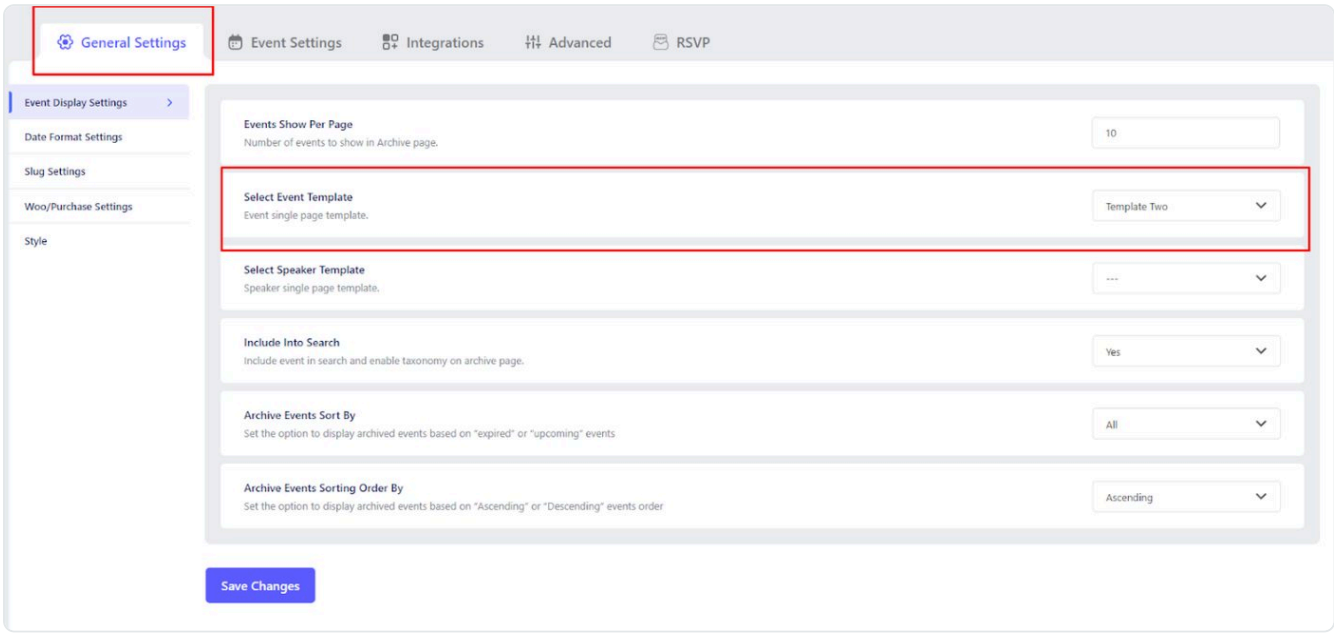

Now let's get ready to experience a new section – dedicated to gather all the template setup you need for your events on WordPress. From landing page templates to certificates, this section covers all the ready-to-go templates with outstanding designs.

Event Landing Page:

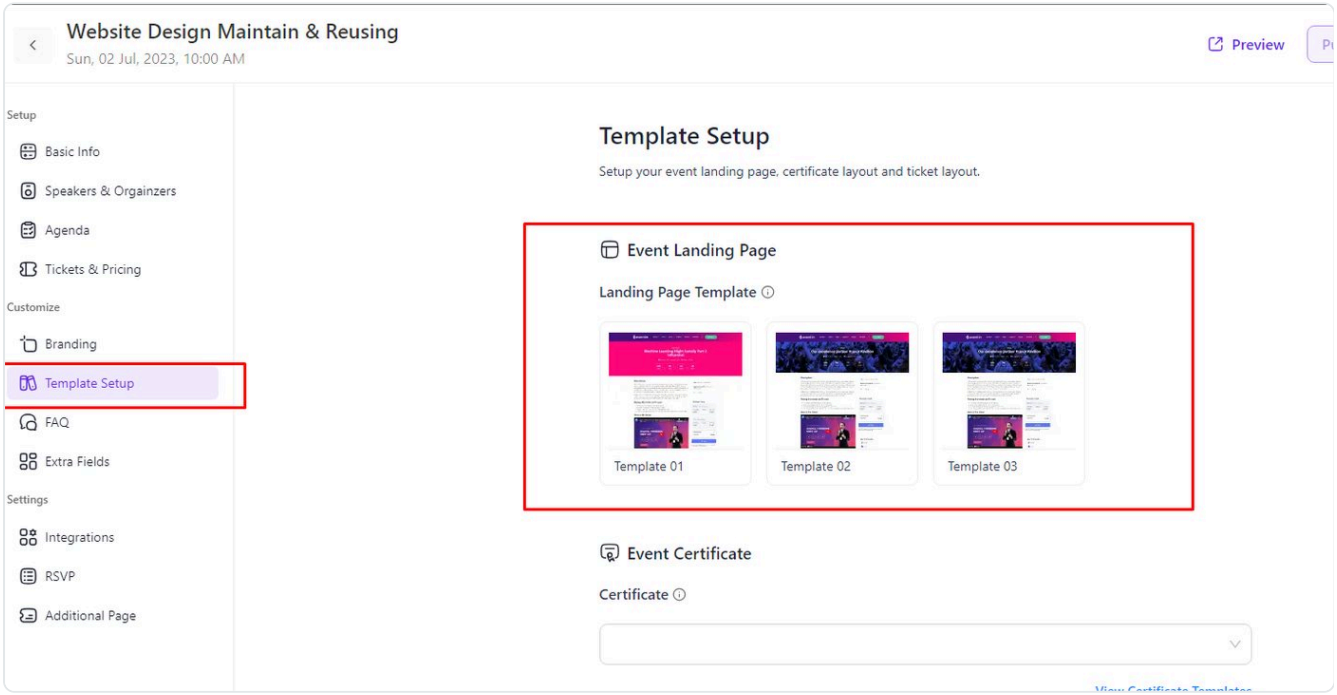

Writing sample by Iftekhar Ahmed. Content and screenshots © Arraytics. For portfolio review only; do not copy or redistribute.

In order to create events, you might need a few pre-made & handy event landing page templates ready to go that will do the job quickly as to grab as much attendees as they can, meaning you need sleek-designed templates.

Back in the old version, you could select a few event templates but they were hard to preview, as you would have to select your preferred templates from the drop-down list.

But things are now way easier with Eventin 4.0, because now you can preview each of these event templates side by side, **and different event templates can be set up for each event**.

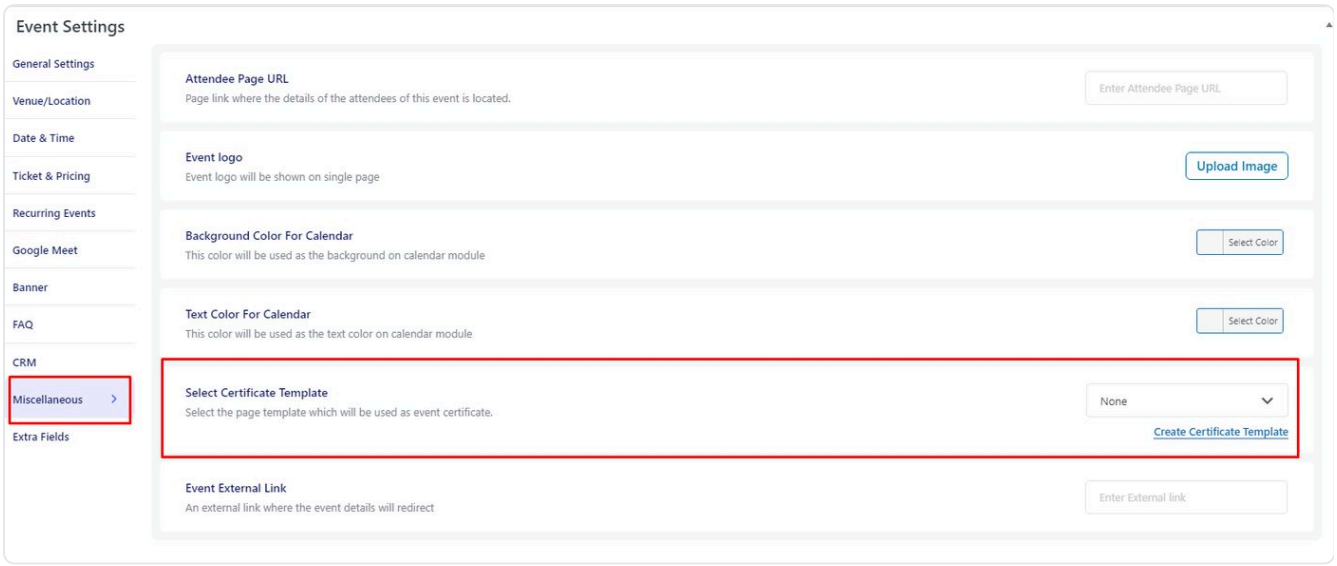

Writing sample by Iftekhar Ahmed. Content and screenshots © Arrautics. For portfolio review only; do not copy or redistribute.

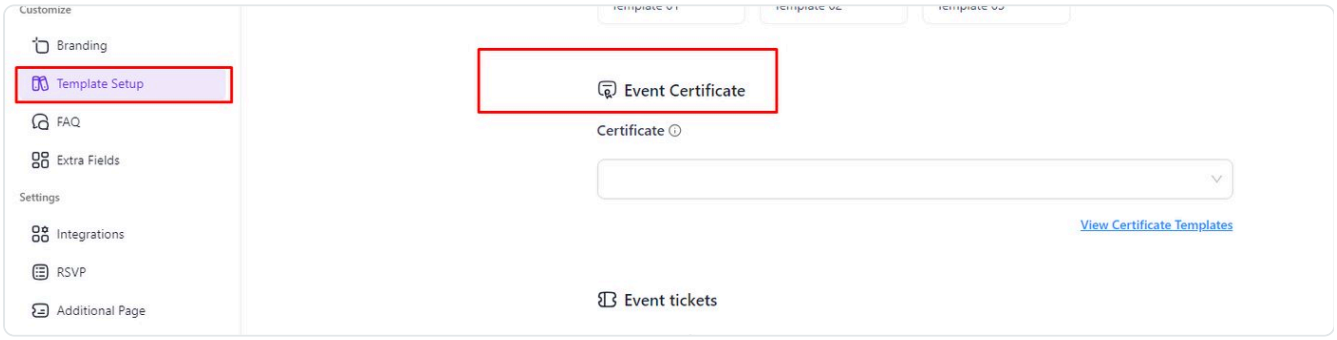

Certificate Template:

Events Certificate is a money-grabber, because it cheers up your attendees that keeps them waiting till the end.

But previously it was a bit difficult choosing the certificate templates as they were like a list in drop-down, or you can create a certificate template using Gutenberg, not to mention the fact they were in the **miscellaneous section** where it's a bit hard to find.

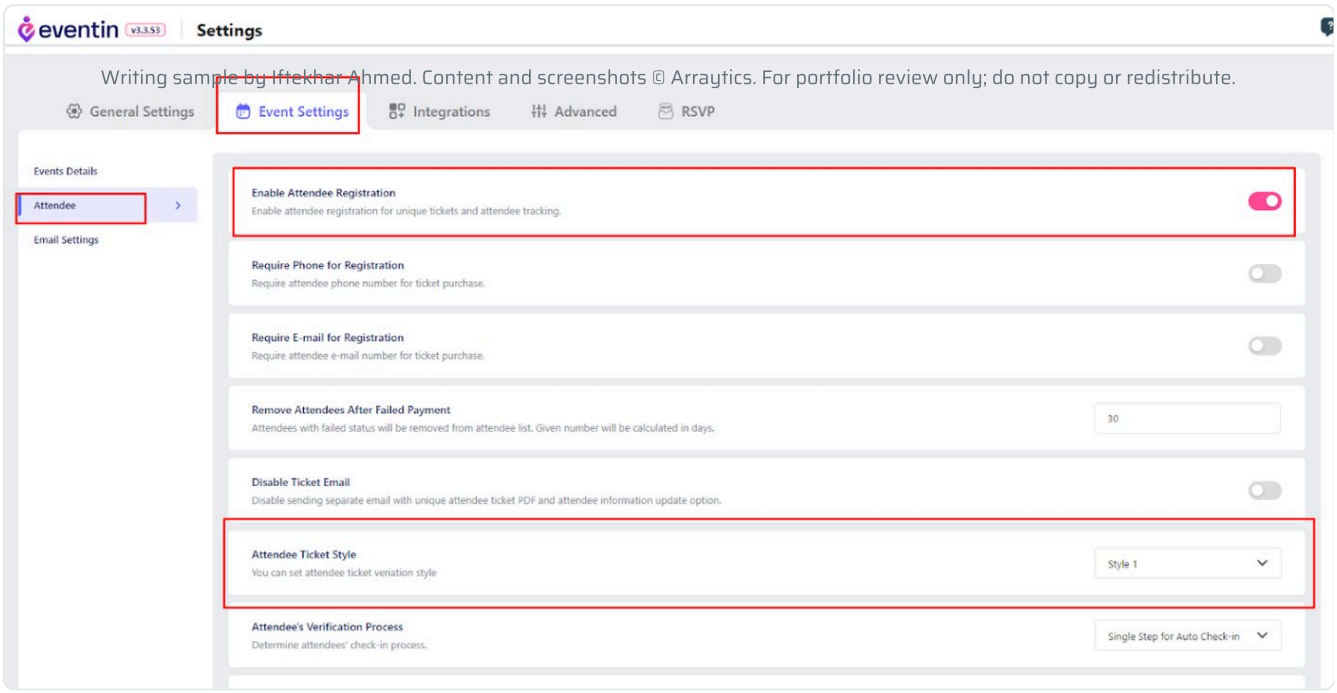

Those old days are over. Now you can have a range of scroll-stopping, conversion-friendly **event certificate templates** that will wow all attendees on the **template setup** section.

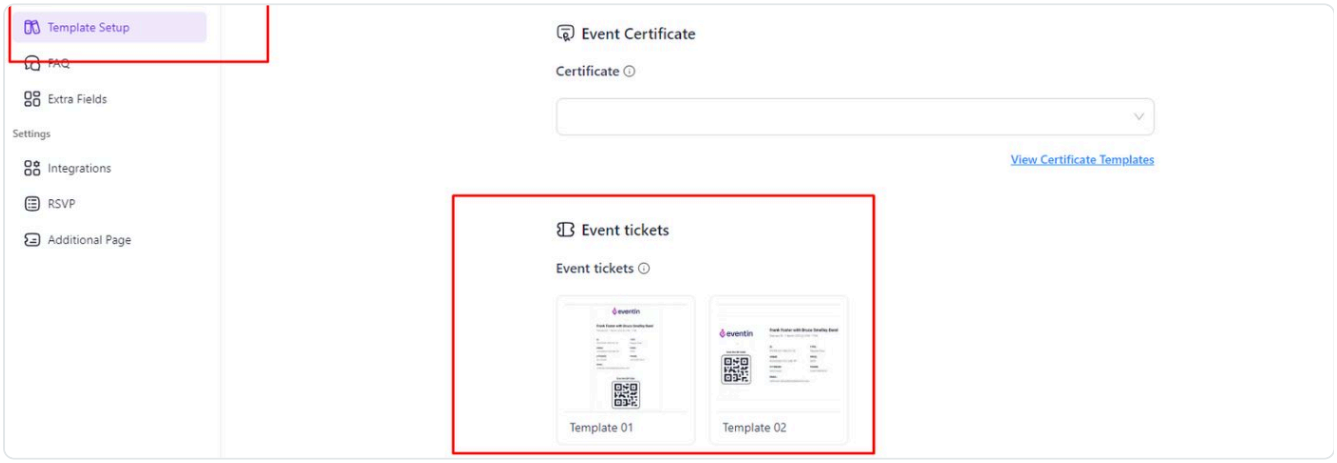

Ticket Template Setup:

Even for the **event tickets** to **sell** during your event **campaigns**, you don't have to create any ticket templates as the Eventin version 4.0 brings about a range of conversion-friendly **ticket templates** to work fast during events.

In the old version, the attendee ticket style was available with a few templates listed on a drop-down section on **Event Settings → Attendee.** Now as a series of templates, the action-packed ticket templates are taken to the **template setup section**.

Here, you can find the **right ticket templates** you need for your tickets to look like when your attendees will register for your events.

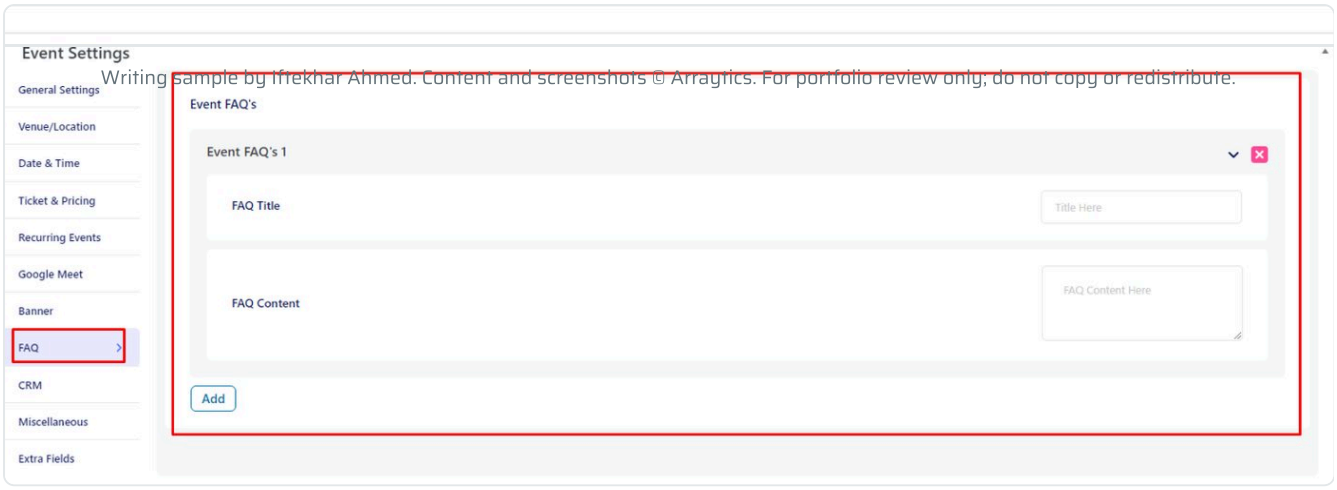

FAQ Page:

We all know how important the FAQ section is for managing any event, where the attendees usually come around with their queries and look for the answers in the event details.

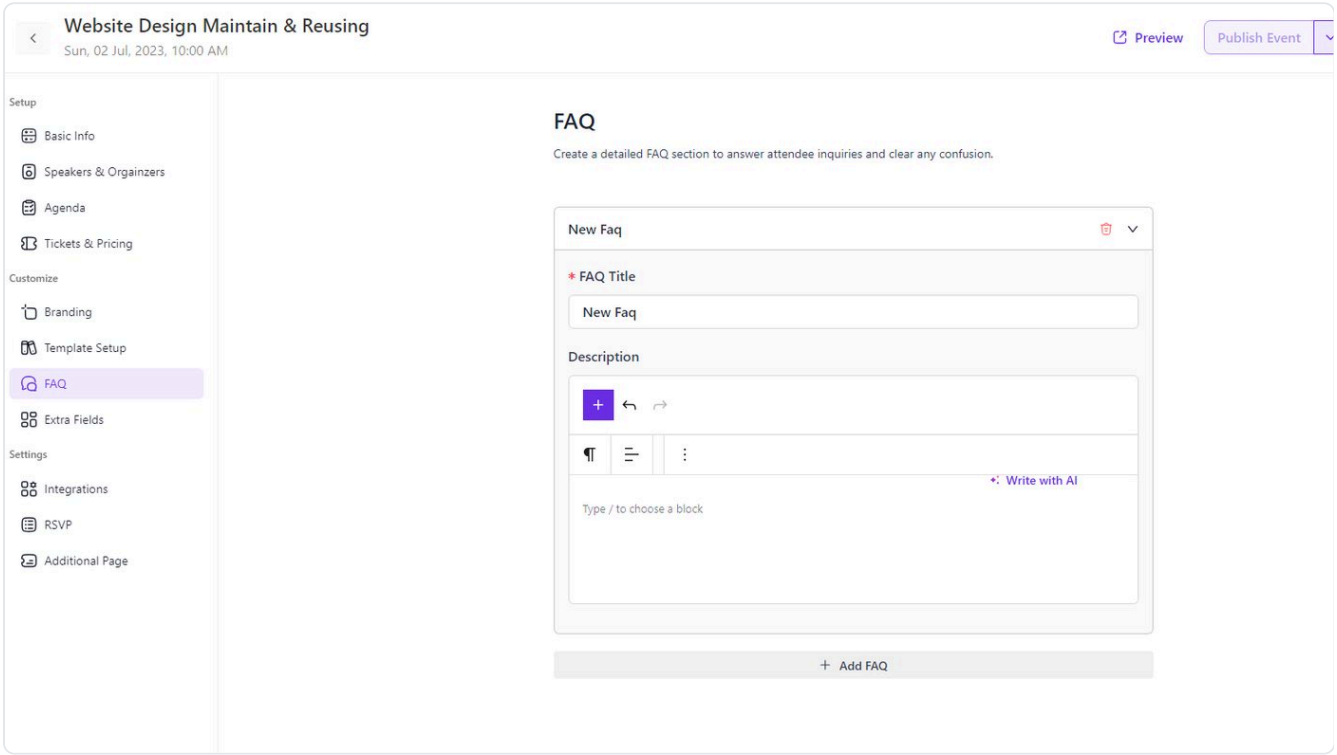

That increases the chance of improved conversion rate on your events.

Beforehand, the FAQ section was in the **Event Settings** section, with little to a few sections like **FAQ title** and **FAQ content**.

Writing sample by Iffekhar Ahmed. Content and screenshots © Arraytics. For portfolio review only; do not copy or redistribute.

There were too many limitations, you couldn't just do anything more than writing the title and description. But things have changed on Eventin 4.0:

Now, located in the **Choose Event → FAQ** section, you can add & edit the descriptions as you wish in different text formats, and you can save a bit of time by writing with AI integration on Eventin 4.0.

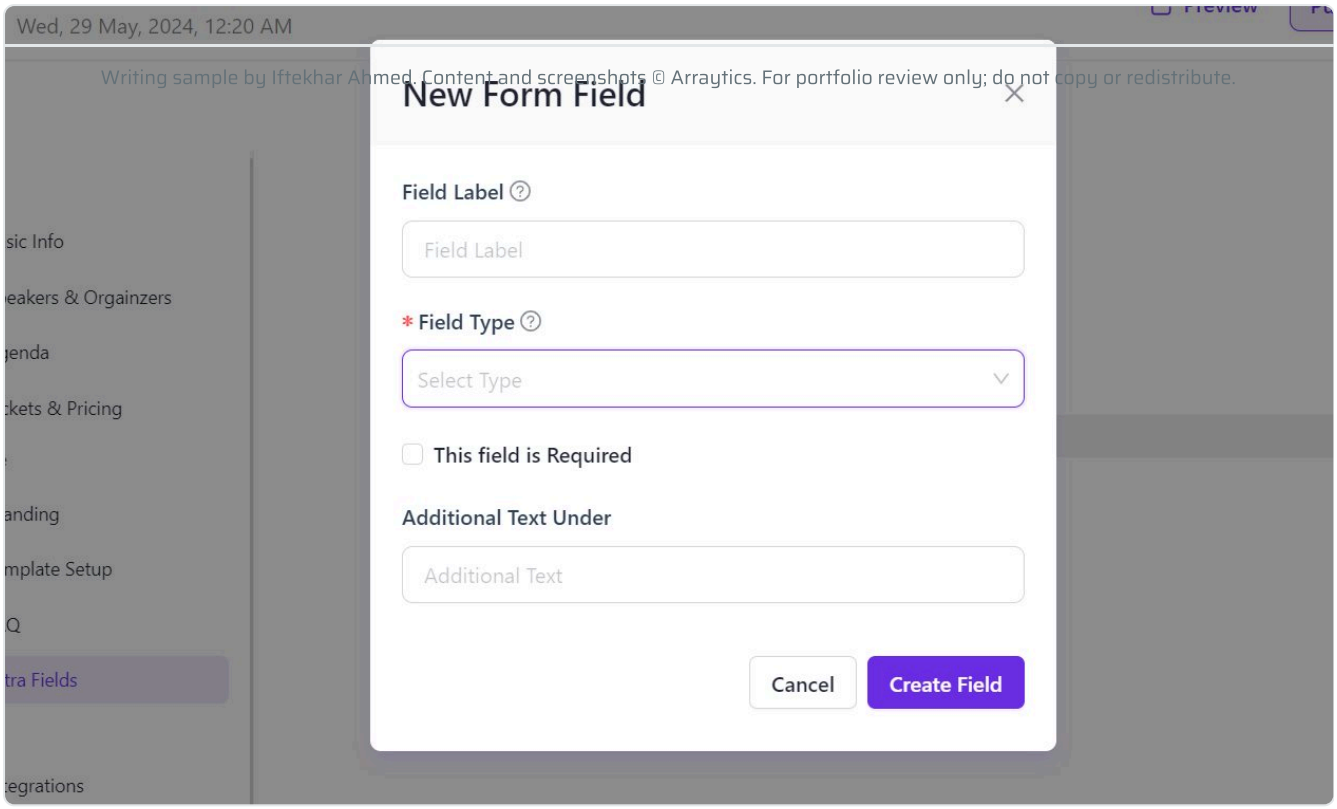

Extra Fields:

Adding extra fields on events carries a lot of weight, but even managers on events deserve to have a better experience on adding them onto their RSVP forms, **right?**

And the worst part, **it was horizontal**.

Back in the old days, we know it was a bit confusing to add the extra fields with details and we've been thinking about improving it for so long.

Now here it is:

Now re-designed in a vertical pattern, you can just add your details easily, with different types of field types like **checkbox**, **one-liner type**, **number input**, **paragraph** etc.

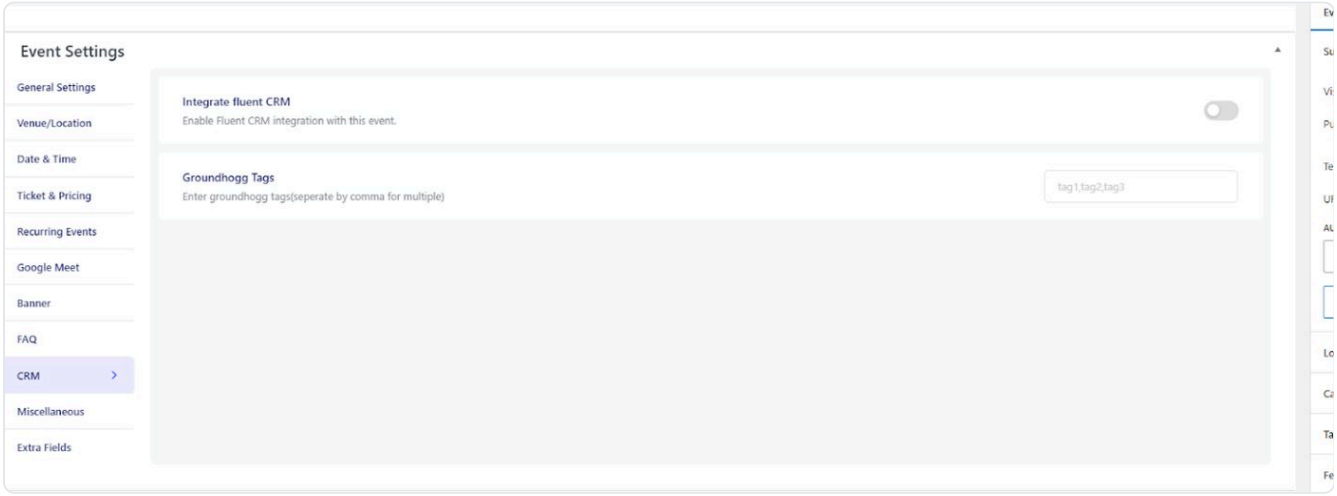

And the best part?

After **saving the new form field**, you can simply drag and drop the extra fields to rearrange the orders.

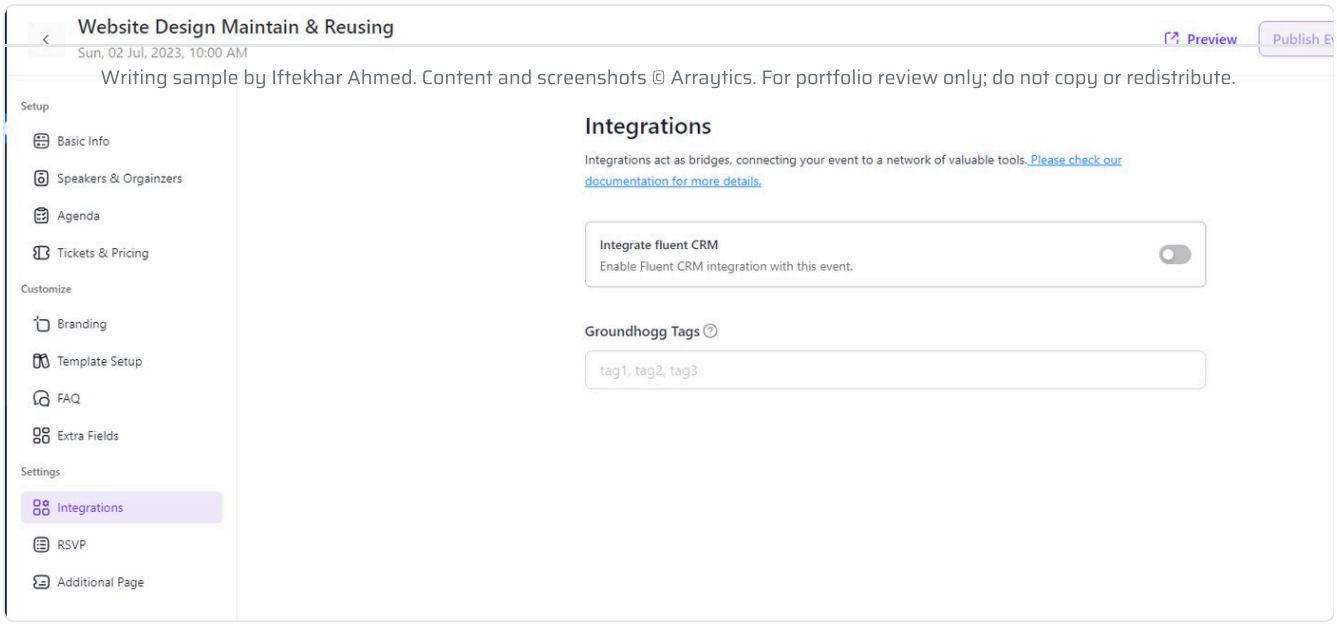

Integrations Page

Integrations act as a connection between platforms, that lets you manage your events better.

Which is why, you need to **be alert about** the integrations whenever you're working on creating & organizing a new event. Before Eventin 4.0 came about, the integrations page was located on **Event Settings → CRM.**

But for a great user experience, the newly designed integrations page look like this:

Most event managers want to immediately take a look while they work on the event details, just to see which plugins or tools they have connected with Eventin so far, hence this new design above .

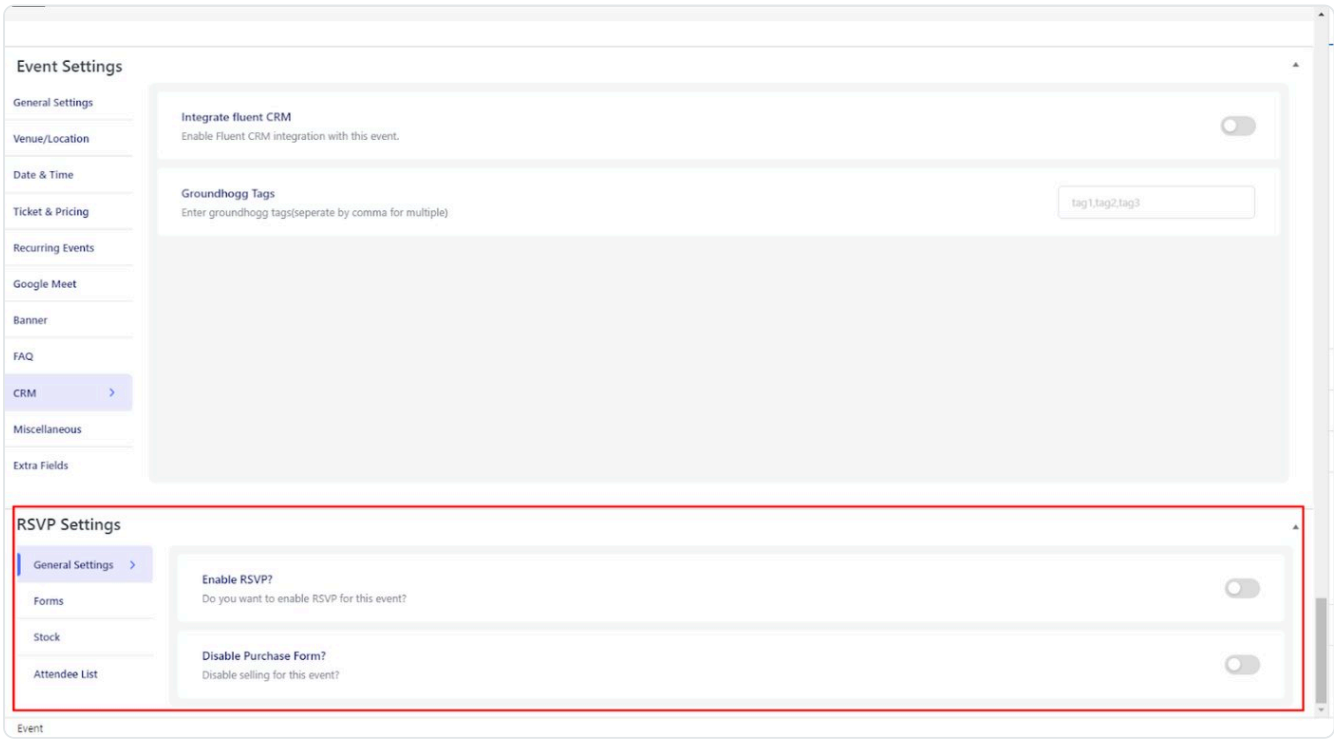

This is how Eventin 4.0 brings the experience into reality.

RSVP: Improved Workflow

Events have one **golden ticket** for conversion: **Even RSVP**.

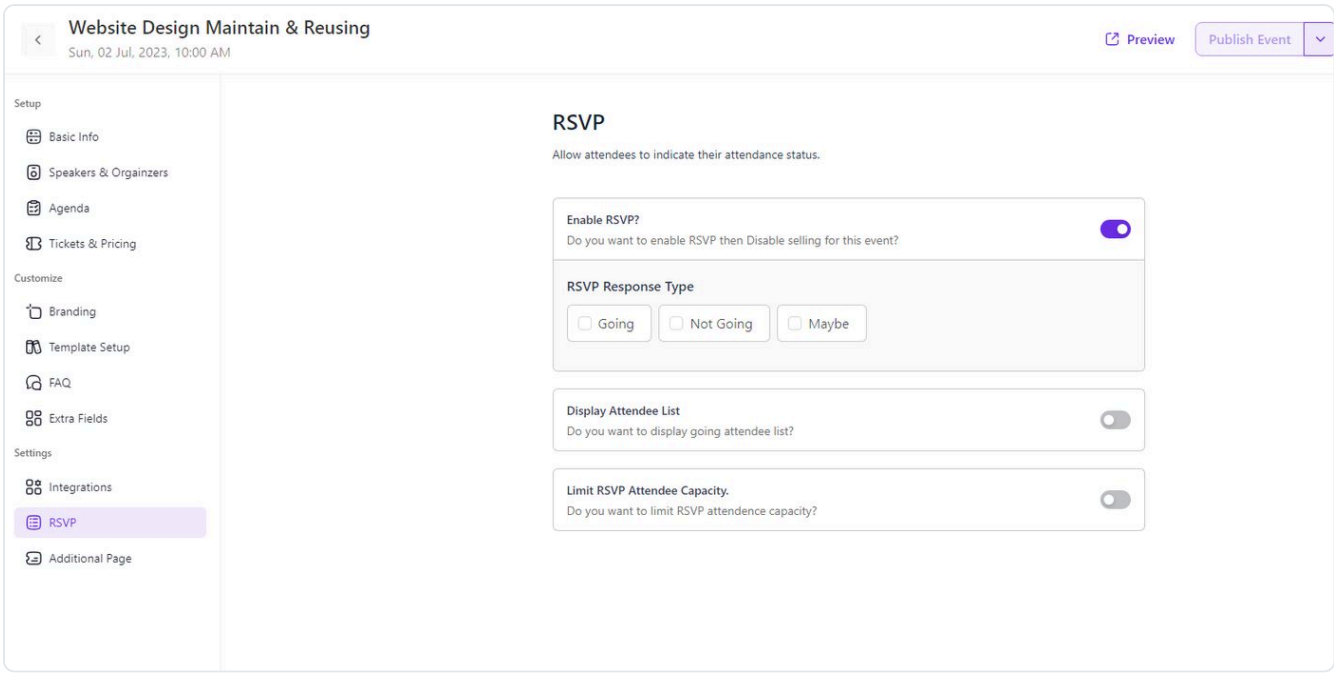

By sending **Event RSVP** to your attendees, you could sense the total capacity of events as well as make the **confirmation** of the interested attendees (ultimately your total revenue).

But previously on Eventin, it was a bit difficult to navigate to the RSVP settings in order to enable the option.

Now, Eventin 4.0 has brought everything to customize under one banner, including Event RSVP with all the options needed for it.

Writing sample by Iftekhar Ahmed. Content and screenshots © Arraytics. For portfolio review only; do not copy or redistribute.

Here you can enable **the RSVP**, select the **response type** options for attendees, showcase the **attendee list** on the **frontend** and even **limit the capacity** of attendee **registration** on the event.

Sound "**way easier than before**", right?

Additional Page

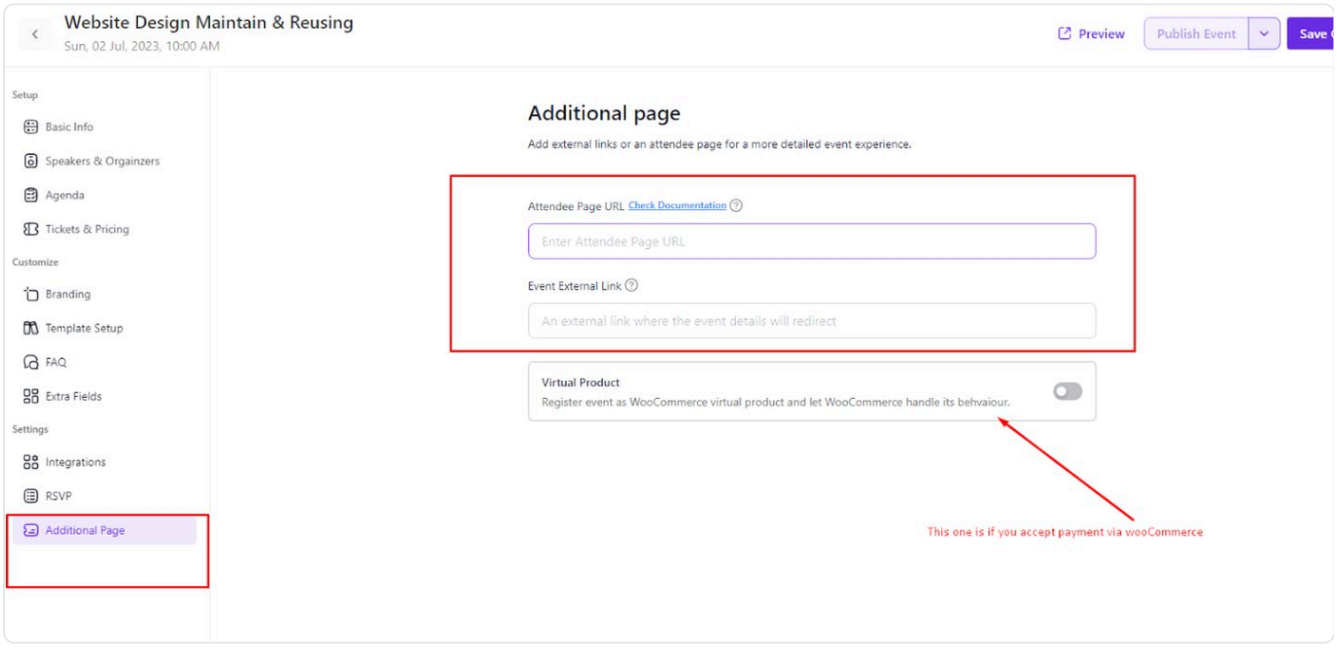

Even after you cover all the details for the events, you might need additional options to brighten up the front-end event details.

The older version used to have the additional options located on the **Event Settings → Miscellaneous** with one option for the (attendee page URL) at the top and another option (Event External Link) at the bottom.

Writing sample by Iftekhar Ahmed. Content and screenshots © Arraytics. For portfolio review only; do not copy or redistribute.

Now, Eventin 4.0 has made a room for additional page on **Choose Event** → **Additional Page**, with a new guest – **Virtual Product.**

As you find the option to share attendee page URL and event external link on your event pages, you can also turn an event work into a WooCommerce virtual product while WooCommerce, as a plugin will deal with the virtual product as an event.

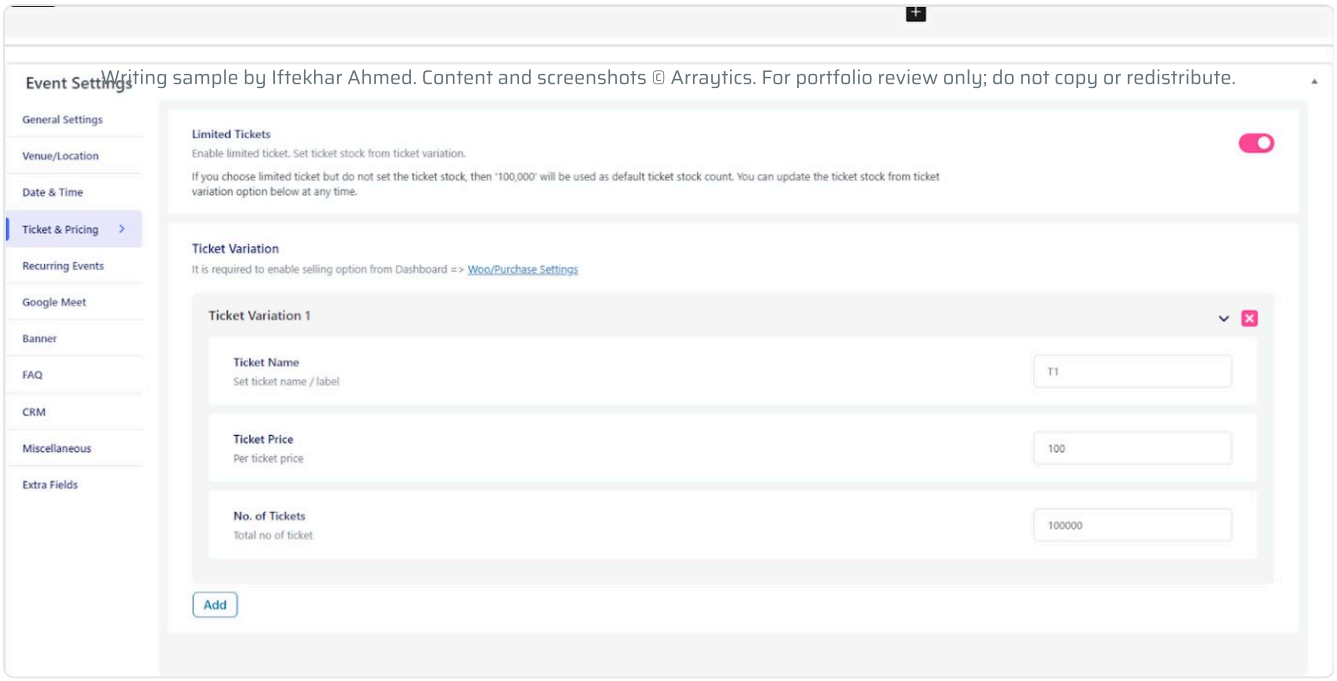

This option is available if you integrate WooCommerce and accept payments via WooCommerce.

What do you think? Would you like to try the **Virtual Product** once?

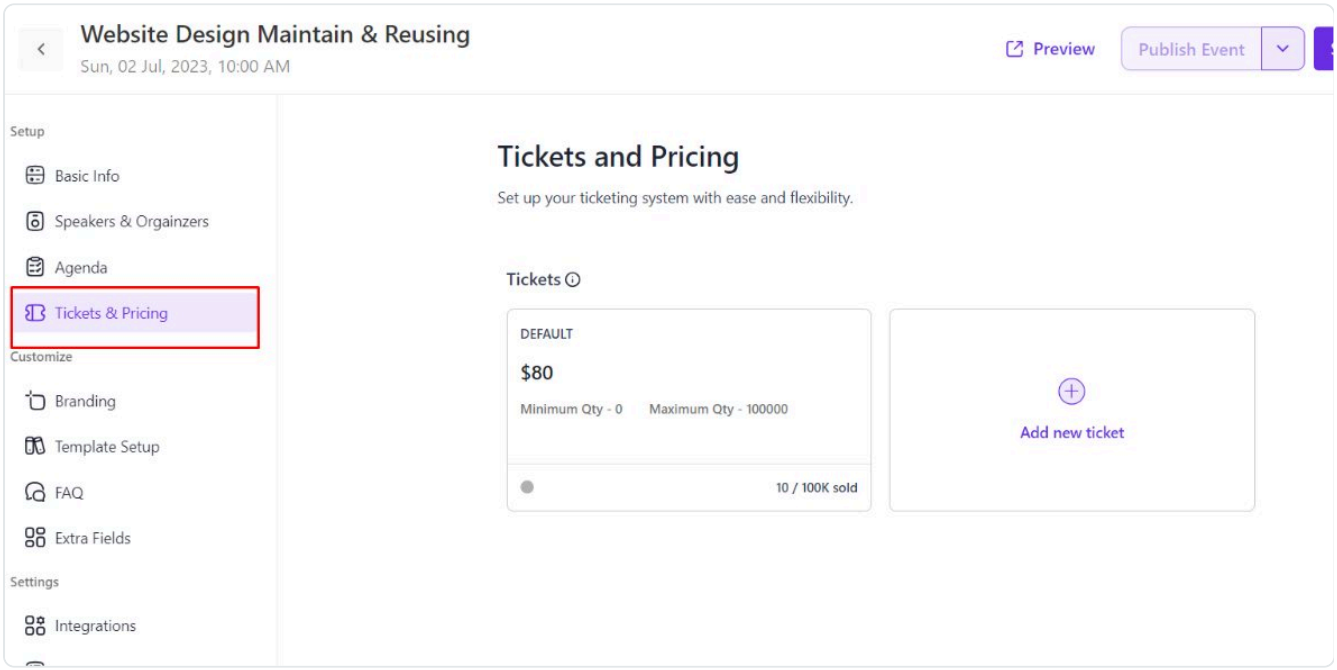

Improved Ticket & Pricing

Back in the old version, setting up the tickets & pricing was a bit limited to features. You could just create the variations, ticket limits and that's all.

Writing sample by Iftekhar Ahmed. Content and screenshots © Arraytics. For portfolio review only; do not copy or redistribute.

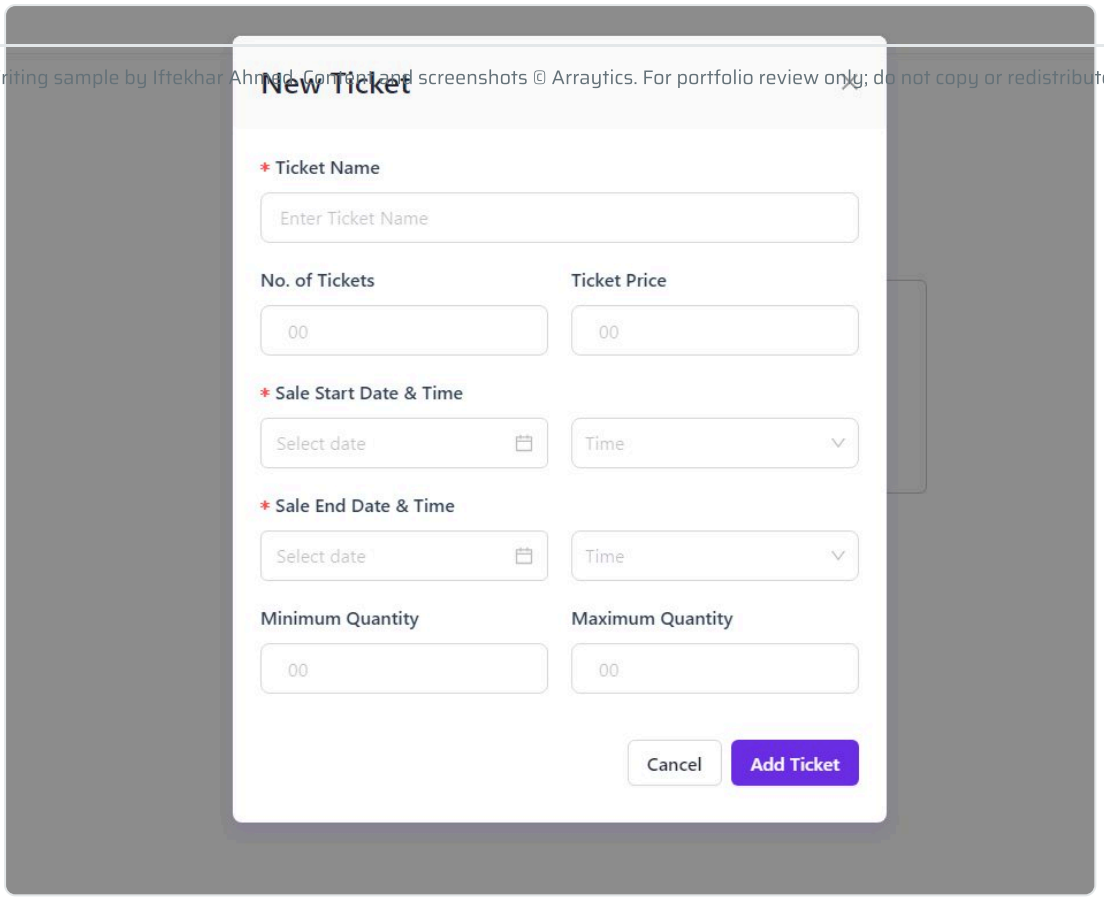

But now in Eventin 4.0 you get to experience a new version of ticketing – making different ticket variations and an easy user interface (UI) to build a new ticket.

Not only that, the **New Ticket** form looks much fresher, with the required fields on point to create a ticket just in time.

Writing sample by Iftekhar Ahmed. Content and screenshots © Arraytics. For portfolio review only; do not copy or redistribute.

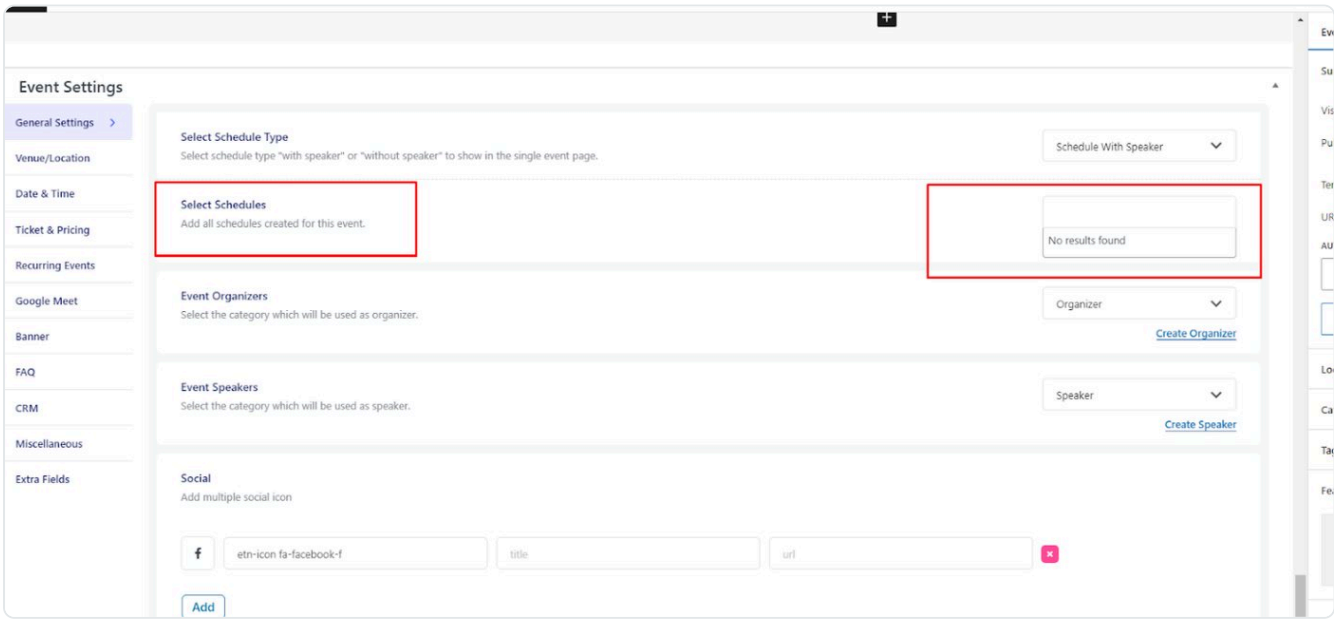

But here's a catch:

With Eventin 4.0 you can add a Sales Ticket with **Start and End Date Time** to **allow selling tickets before** the event, in order to control the **selling duration**.

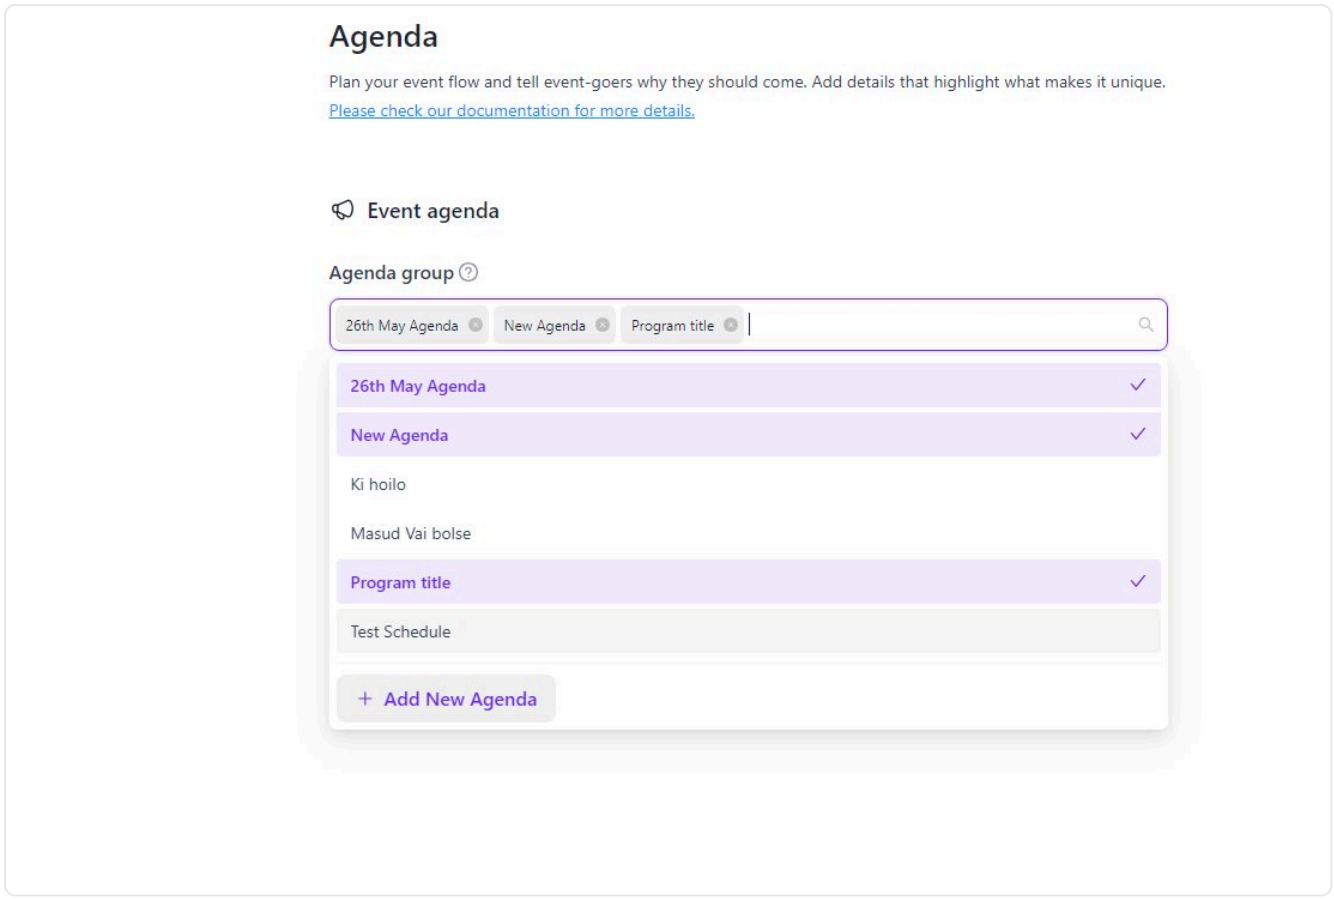

Agenda/Schedule

In order to create a new schedule or select an existing one, the event managers had to navigate to Event Settings → General Settings → Select Schedules. It was a bit far away from creating an event, as it is very much contextual when you need to create one.

Now you can craft your event without ever leaving the planning flow. Build a custom schedule from scratch, or pick a pre-made option – all within the same intuitive interface.

Writing sample by Iftekhar Ahmed. Content and screenshots © Anagitics. For portfolio review only; do not copy or redistribute.

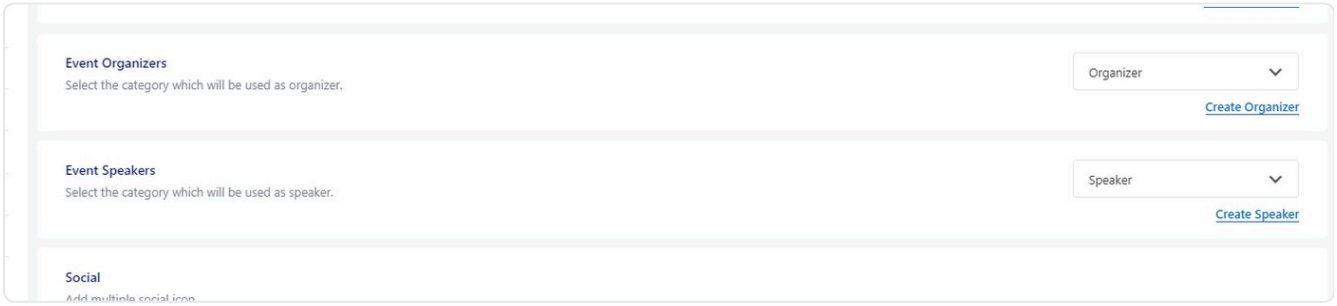

This seamless experience **of Agenda** lets you focus on what matters: creating a fantastic event with customizable agenda or agenda groups.

Event Speakers and Organizers

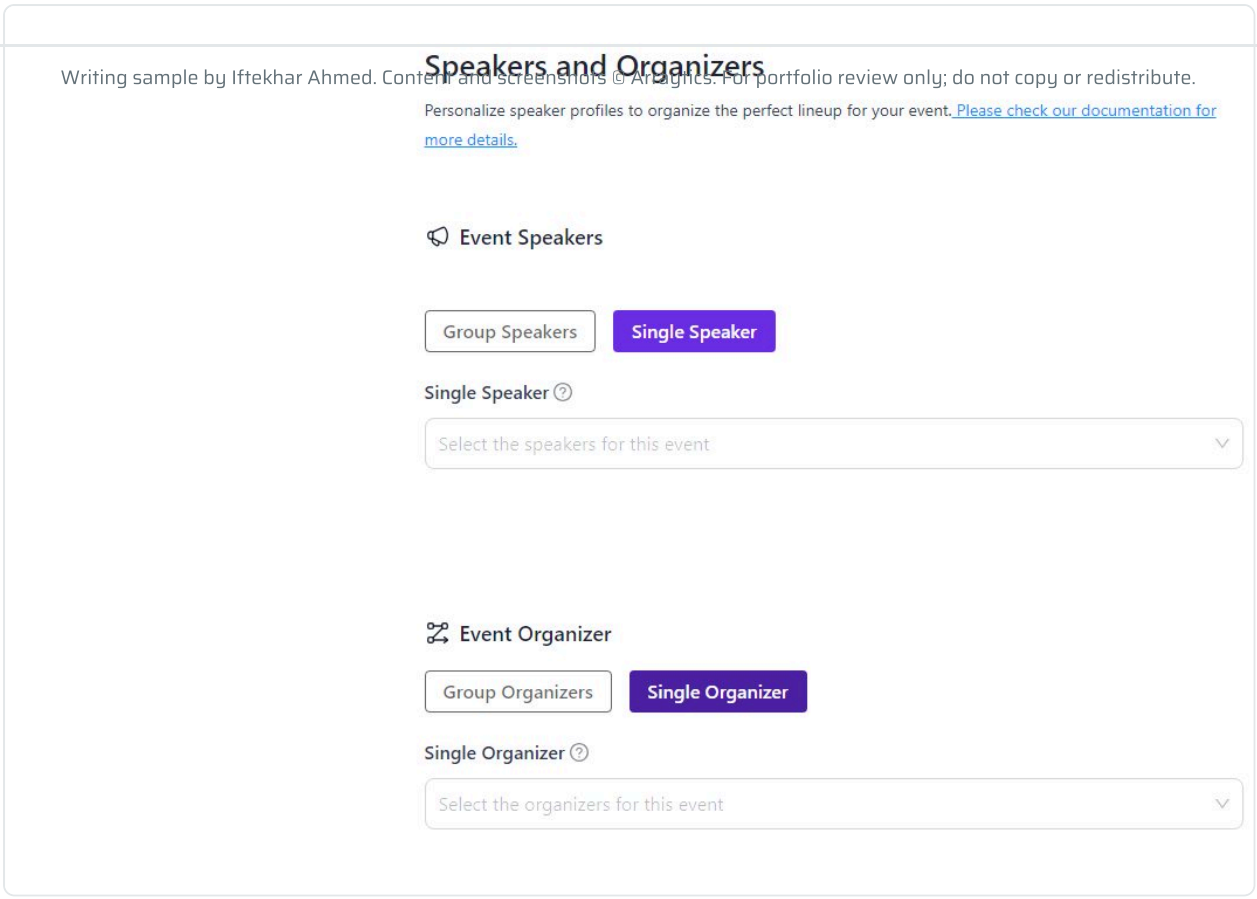

Things were simple back then.

When you used to select event organizers and speakers or click on **create speaker**, but the features were limited like there were no options for selecting organizers or speakers by group.

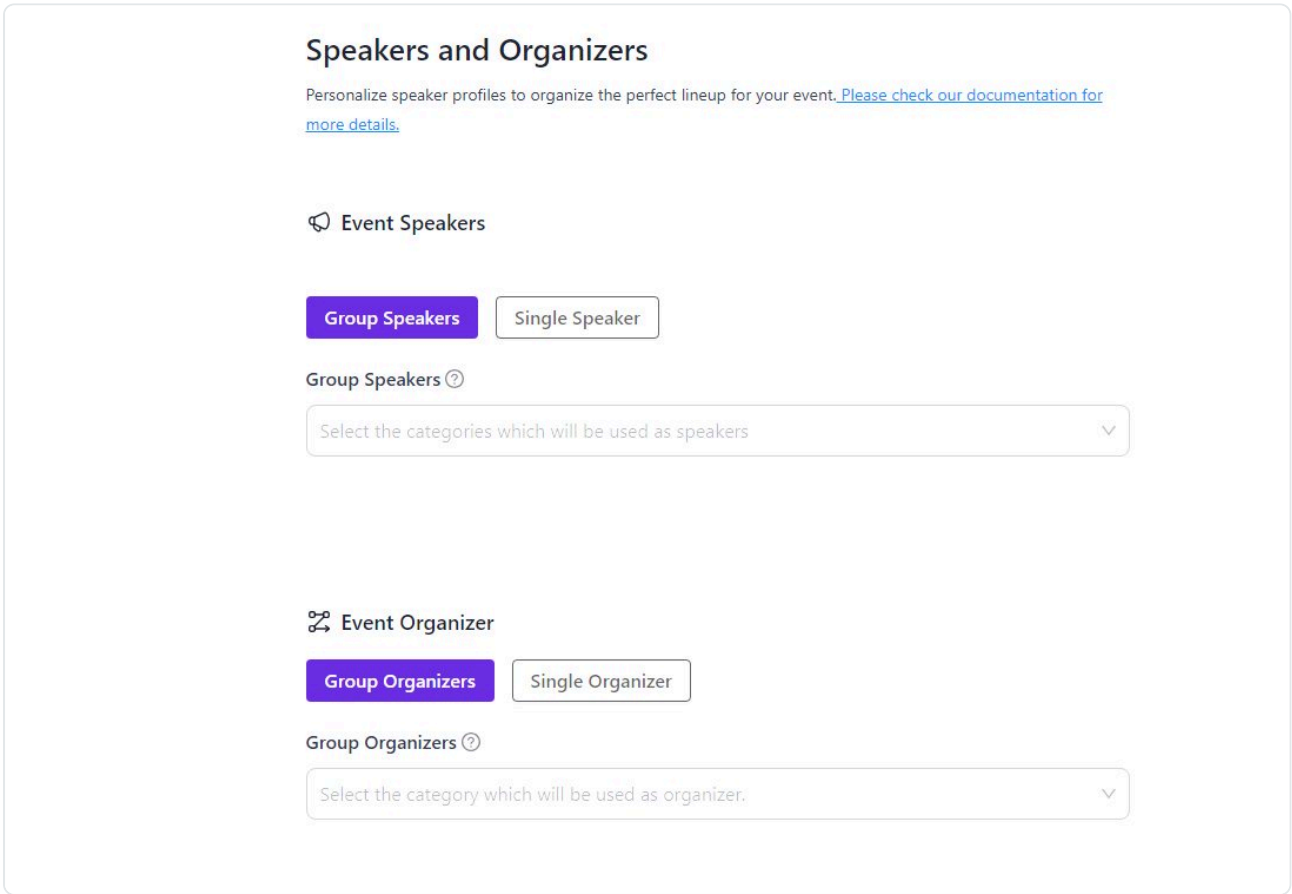

Well, no more!

Writing sample by Iftekhar Ahmed. Content and screenshots © Anaglics. For portfolio review only; do not copy or redistribute.

Event speakers and organizers can now be added easily as groups, without even leaving your editing action.

But here's the fun part: Not just single, you can add these speakers/organizers **in groups**. This saves time when you have to organize multiple speakers for one sessions or different sessions, without leaving the editing page you're working on.

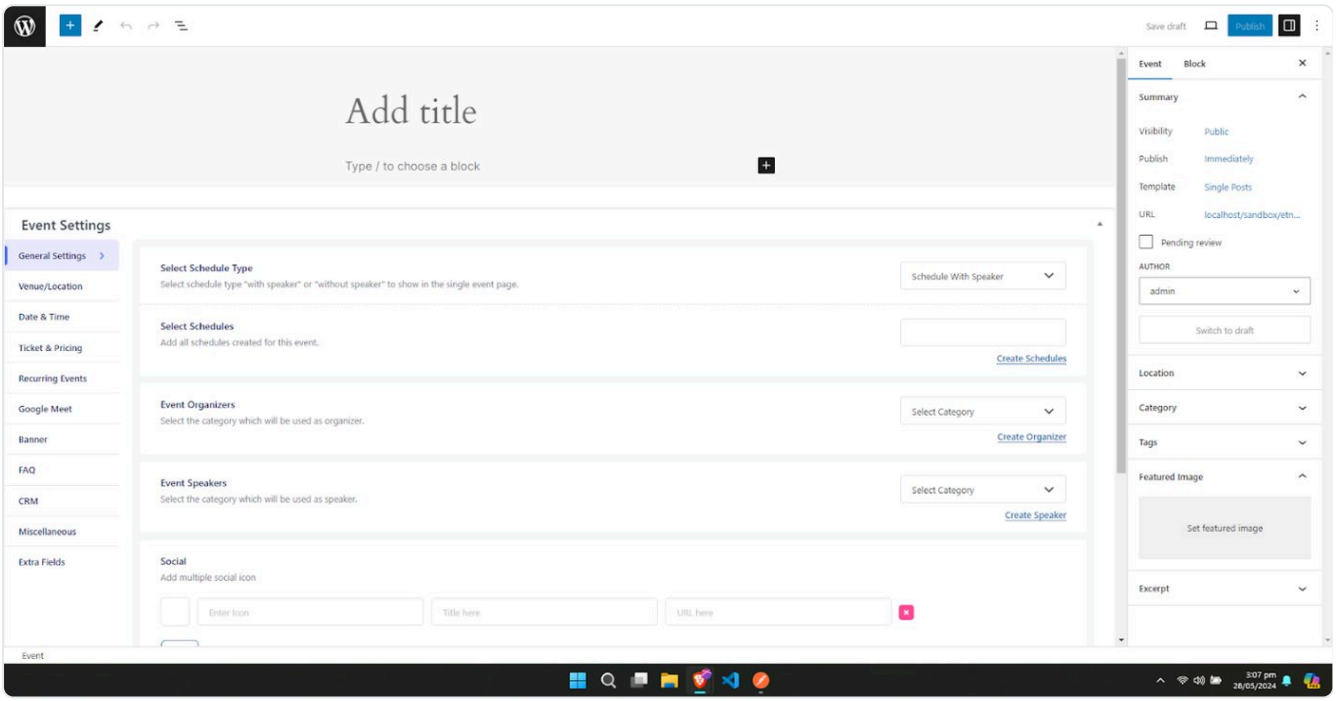

Writing sample by Inekhai Ahmed. Content and screenshots © Anaghics. For portfolio review only; do not copy or redistribute.

That can save you a lot of time while creating the blockbuster event.

Full Update: Event Creation Page

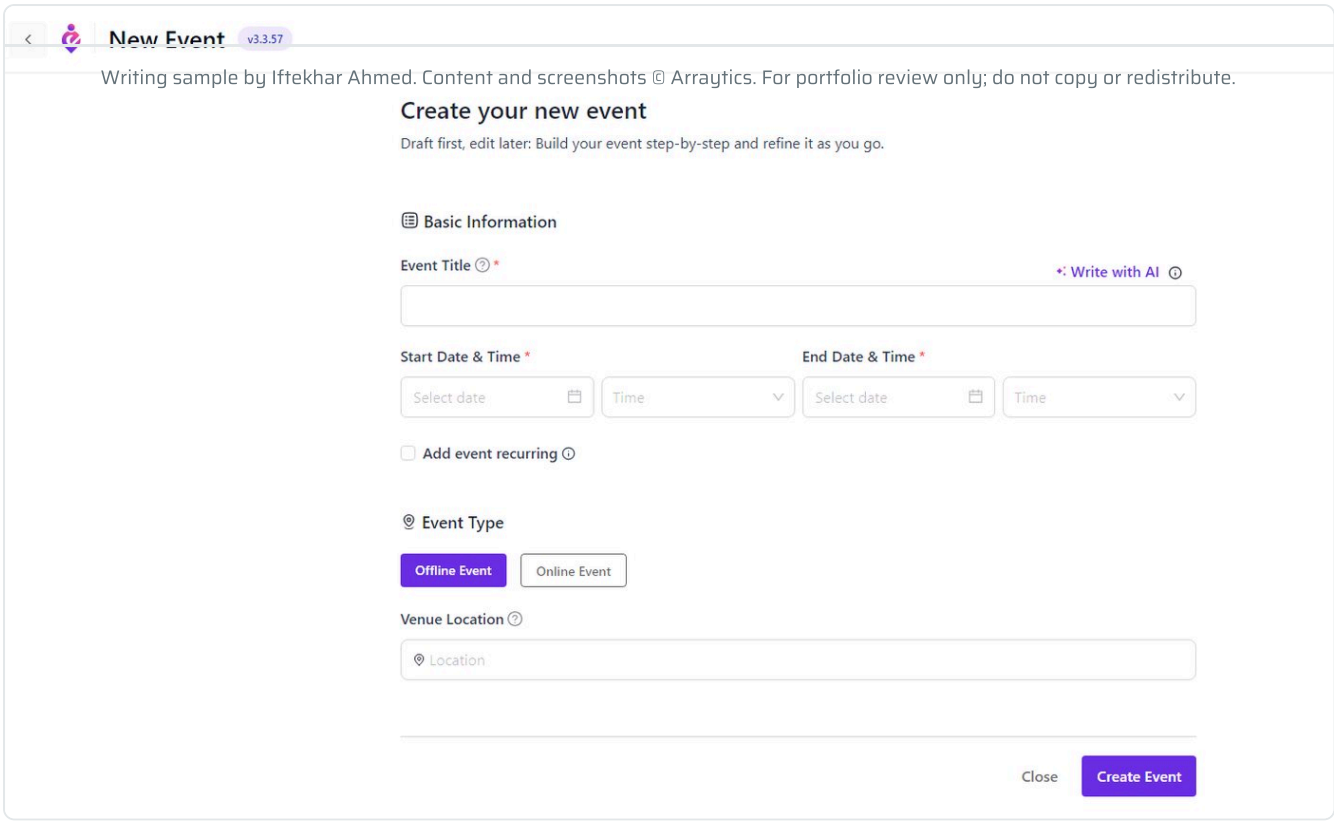

Create an Event with minimal information

Back in the old days, you would have to swim across an ocean to create an event with a bland user interface, with a harsh readability as you have blocks and sections on the center and right and left sections on the same screen.

Now on Eventin 4.0, creating an event is now even better as you can create an event with a minimal information and description, within a few clicks.

Writing sample by Iftekhar Ahmed. Content and screenshots © Arraytics. For portfolio review only; do not copy or redistribute.

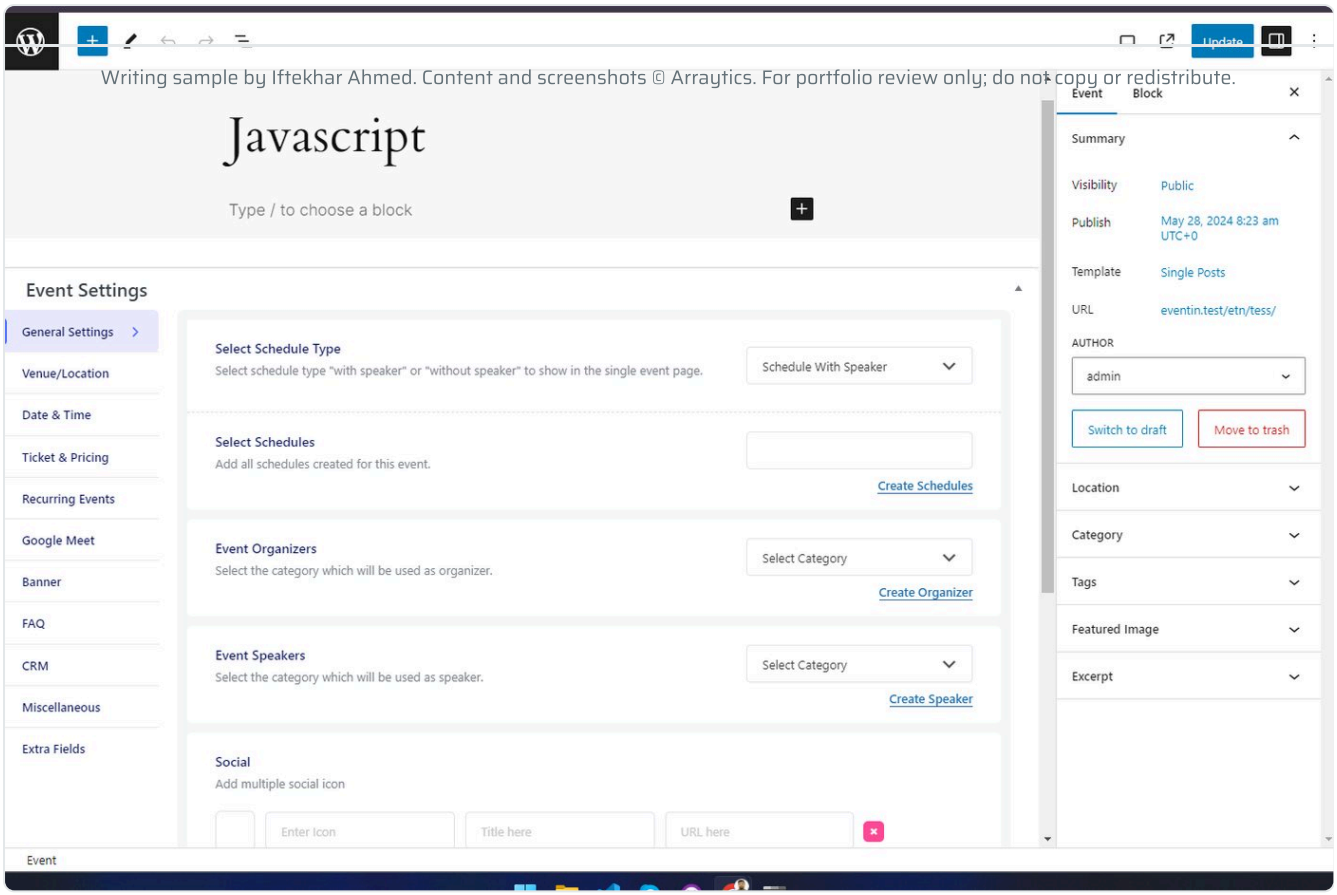

All you have to do is add event title, set the start & end date time, and select the event type right below the calendar – and you're all good! In short, you can create an event much faster on the new version without looking right or left and definitely without much stress on the eyesight.

New Descriptions Added while creating an event:

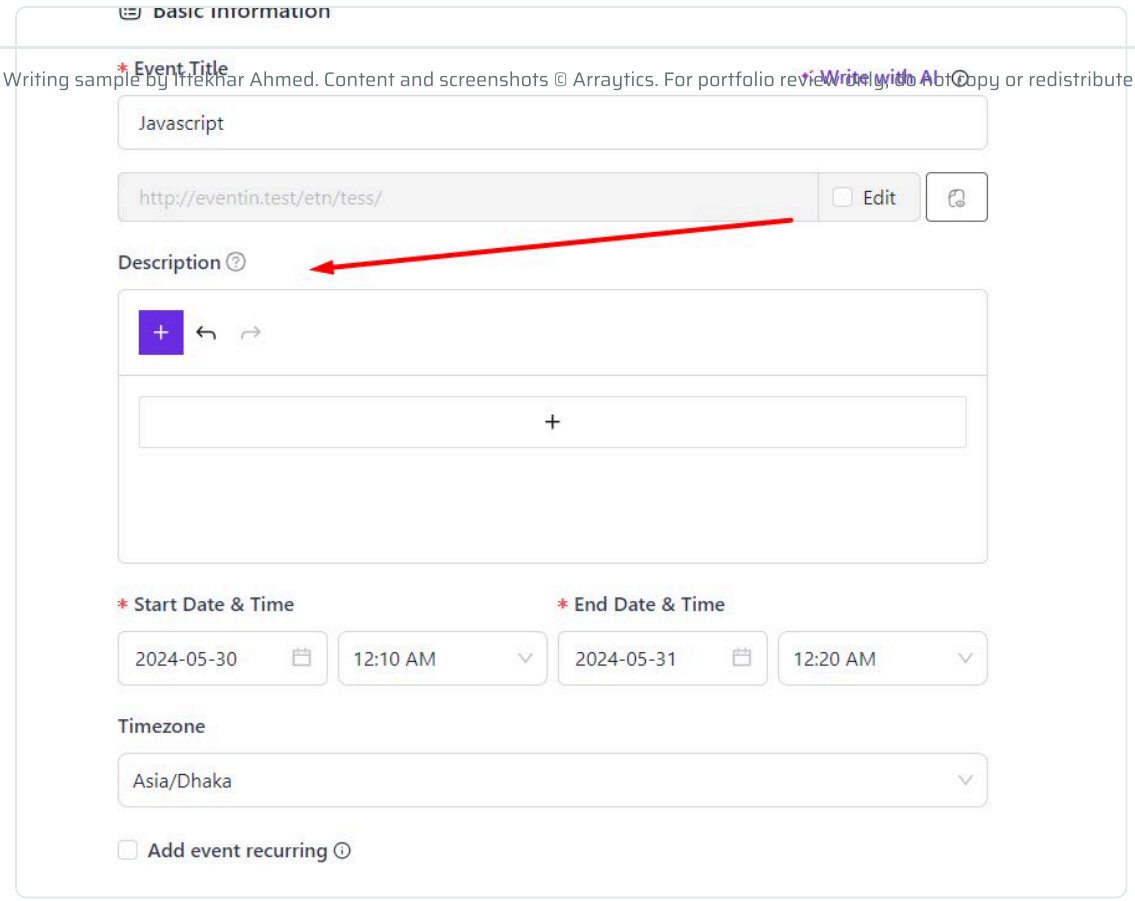

Creating an event previously felt like adding a post on WordPress CMS. It all looks the same, with the same old Gutenberg blocks, but the work feels like bland.

Writing sample by Iftekhar Ahmed. Content and screenshots © Arraytics. For portfolio review only; do not copy or redistribute.

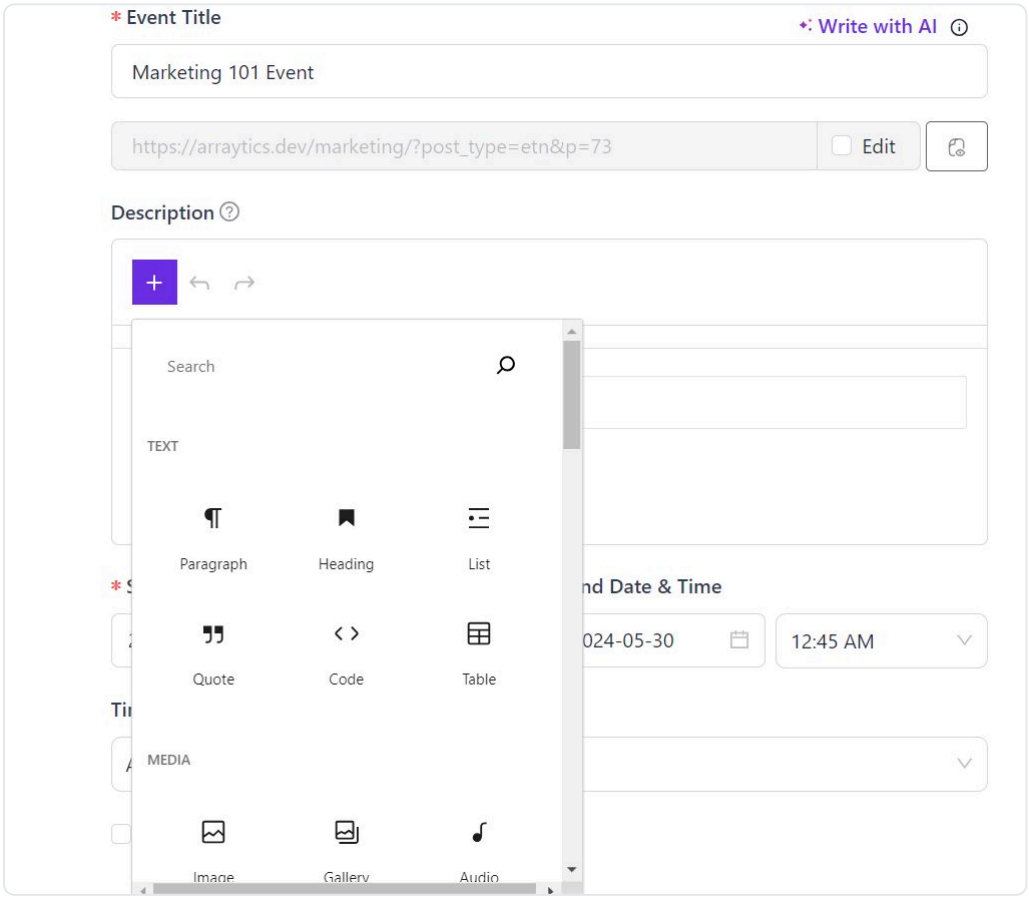

But in the new version on Eventin 4.0, things are looking way fashionable with a newly added **event description** section, so now you don't have to create a block for the description whereas directly about the descriptions firsthand.

Writing sample by Iftekhar Ahmed. Content and screenshots © Arraytics. For portfolio review only. Do not copy or redistribute.

To have a touch of the old, you will have a list of block options from Gutenberg once you click on the + icon to add descriptions.

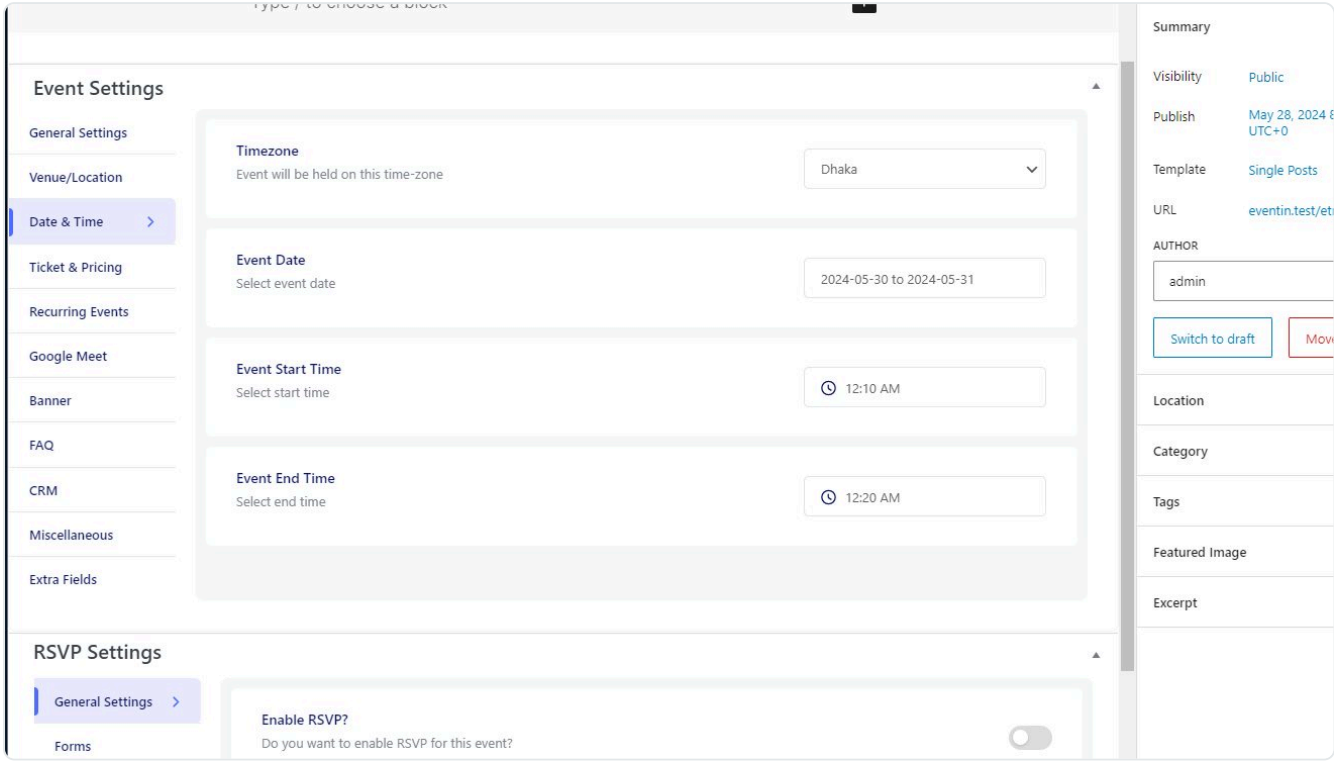

And here's another best part: you can add multiple blocks on the description part.

Writing sample by Iftekhar Ahmed. Content and screenshots © Arraytics. For portfolio review only; do not copy or redistribute.

Added New Style for Event Date Range

Just to be quick on the date range, Eventin 4.0 made changes by adding new styles for the event date range. Previously, the interface would look like this:

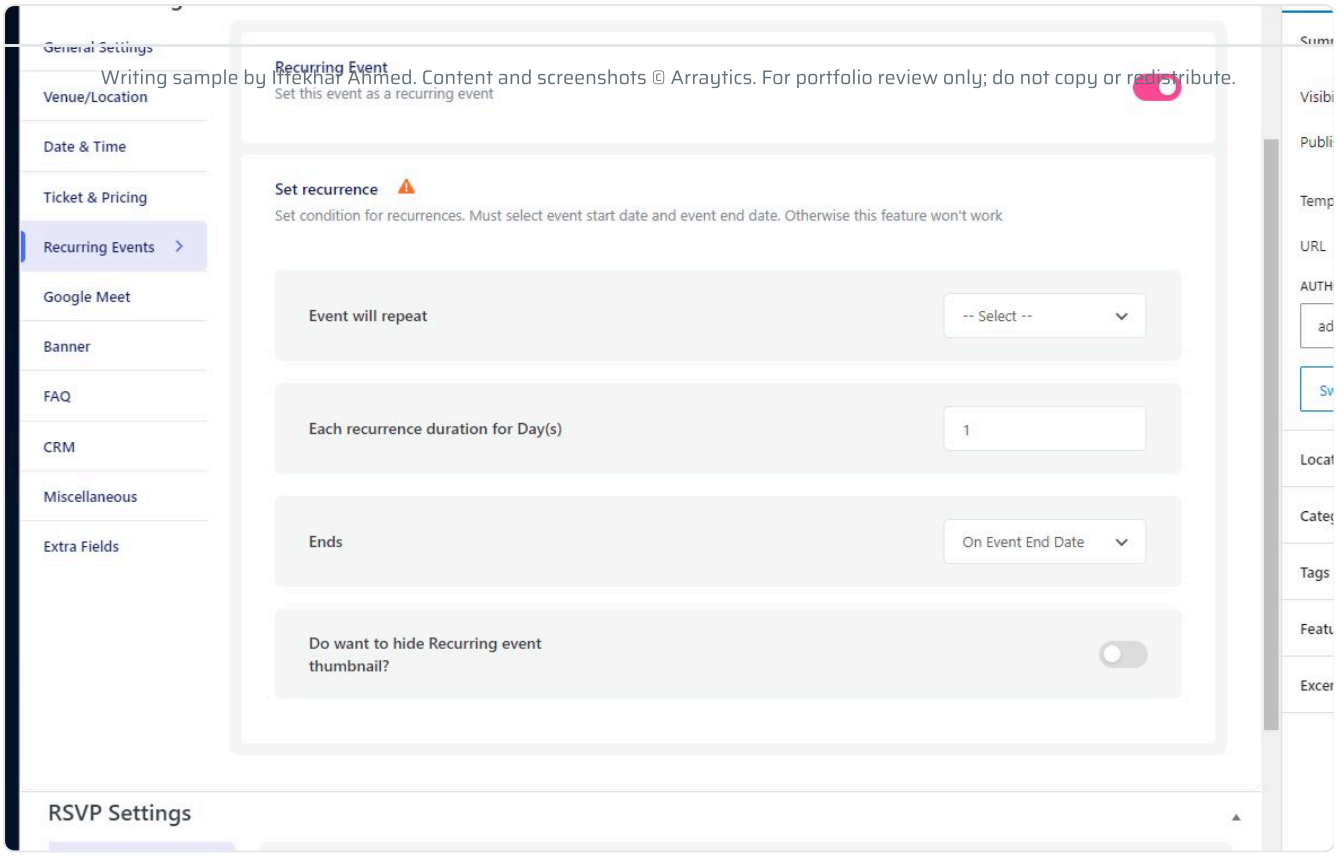

But now in Eventin 4.0, it's getting easier **on the date range** section where you can experience a new look while fixing the (start to end) date range for your events.

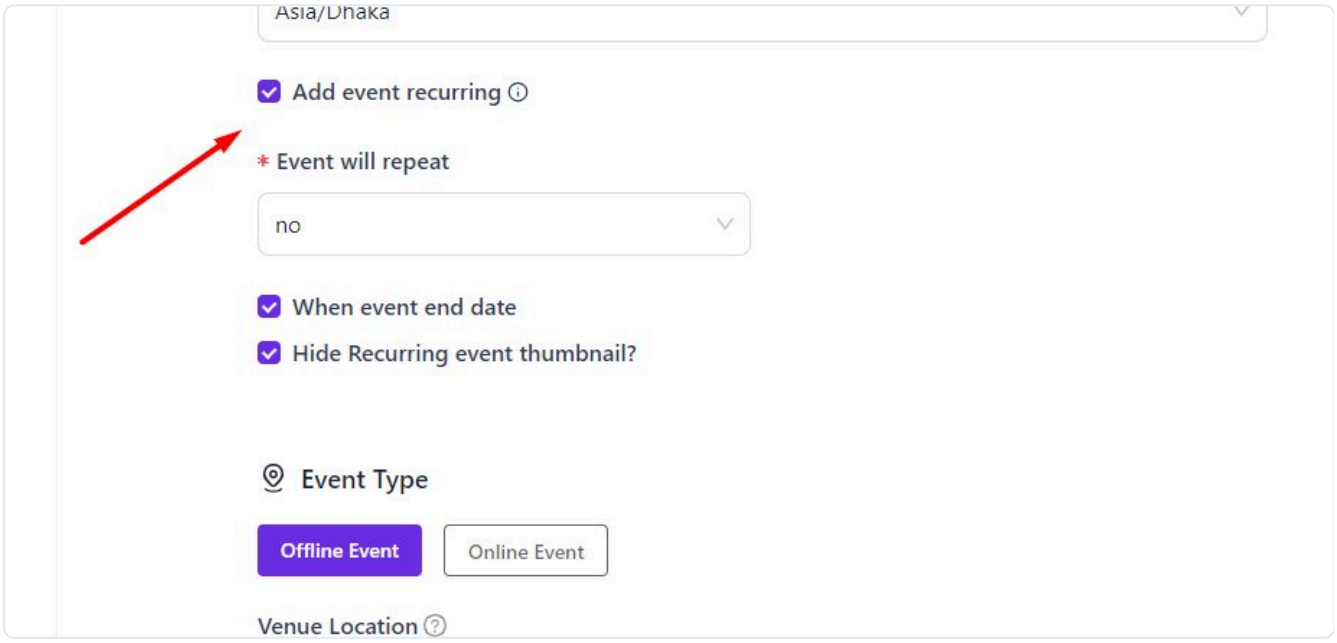

Added New Recurring Event Option

Recurring events are money-makers. But it used to be a bit lengthy on the previous version. Recurring events options could be found on event settings → general settings where you can set the recurrence for any event.

Writing sample by Iftekhar Ahmed. Content and screenshots © Arraytics. For portfolio review only; do not copy or redistribute.

But it's now even easier. Recurring Events option can be found on **Events → Create an Event** and you will simply find the recurring event there waiting with a checkbox.

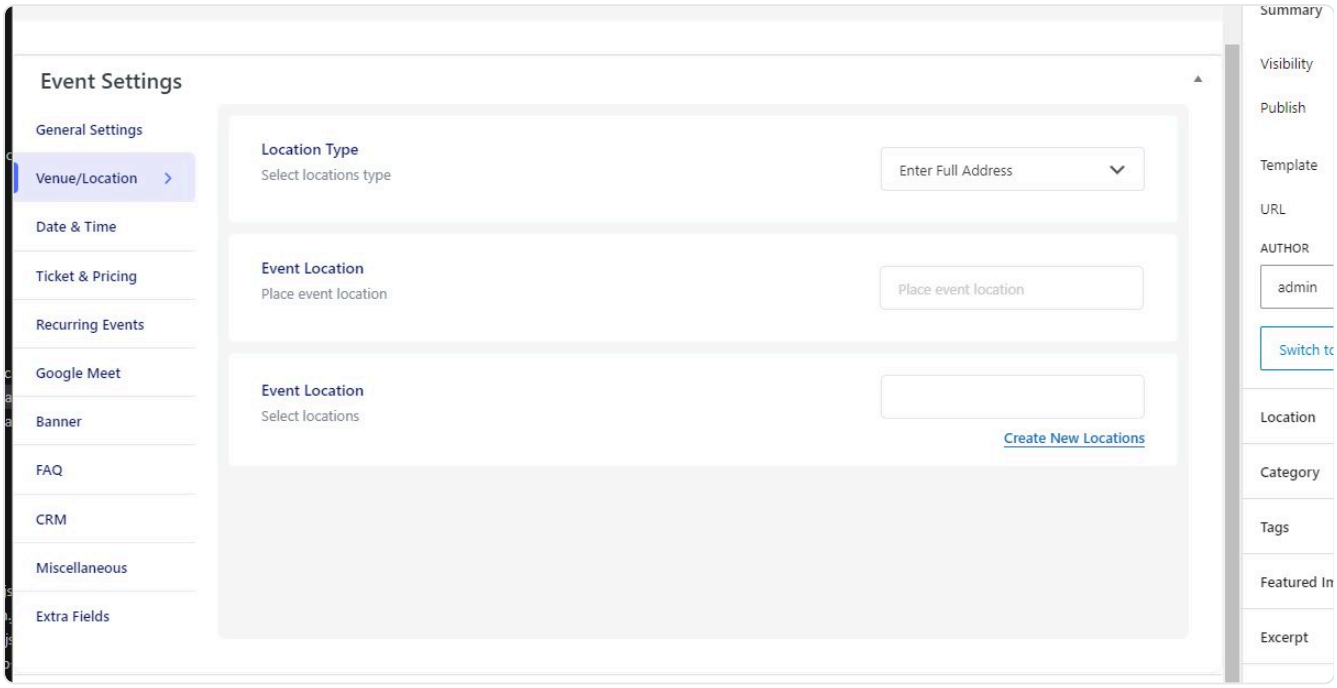

Once you enable it, a drop-down small section for the recurrence as well as the date range of recurrence will take place.

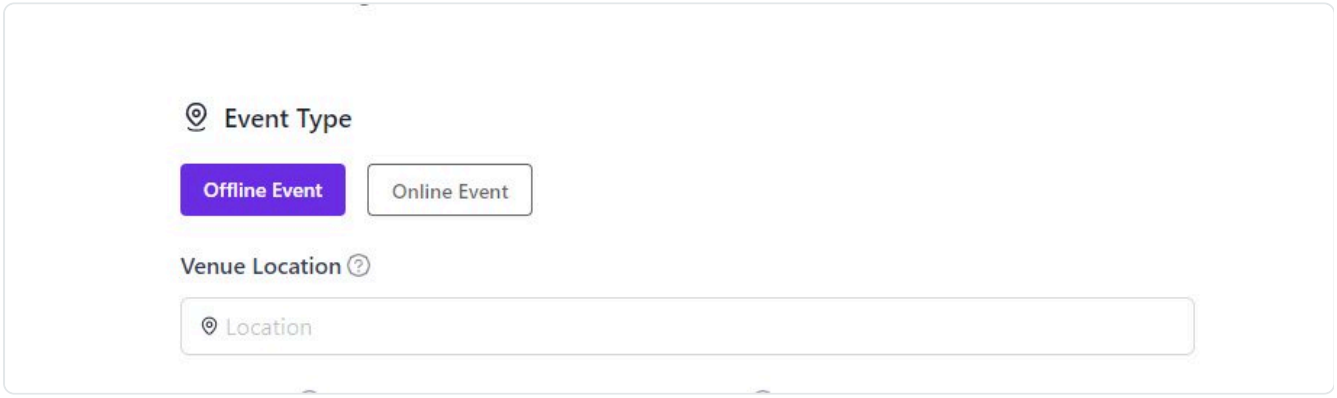

Writing sample by Iftekhar Ahmed. Content and screenshots © Arrautics. For portfolio review only; do not copy or redistribute.

Added Event type offline/ online event option

You know it feels great when you can put all the necessary details in one page for creating an event. Eventin has thought about giving a user experience (UX) where event organizers will create an event and won't switch to another place to fill up another details.

But now you can have the branding section full of essential event details that will not take you roaming to any other pages.

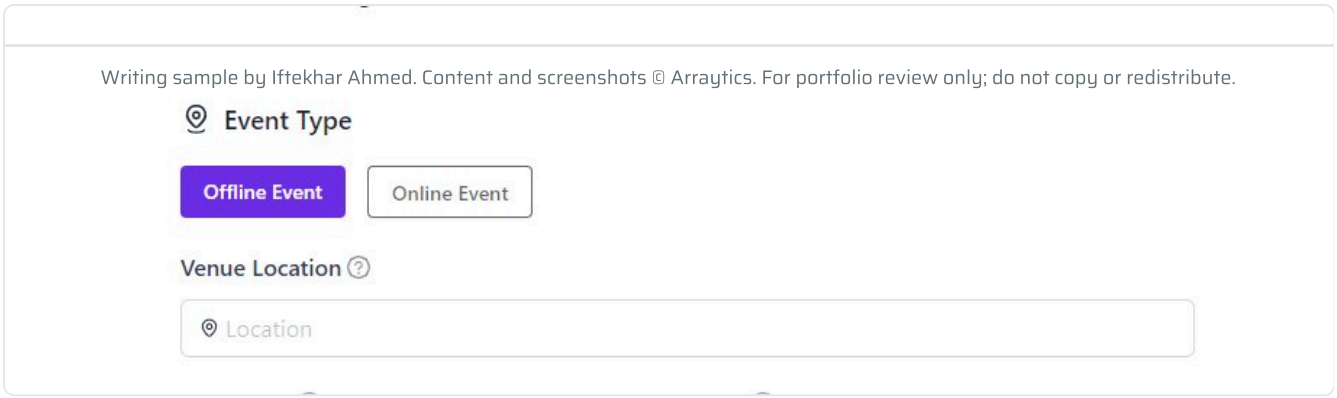

Here you can see an UX update on event type, as mostly it's easier to define the nature of your event in the first place.

Custom Location Field

Just as you soon update the nature of your events, you might need to mention the location on the next step.

Now you can define the event nature and after that, fill out where your event will be held on the location section.

Writing sample by Iftekhar Ahmed. Content and screenshots © Arraytics. For portfolio review only; do not copy or redistribute.

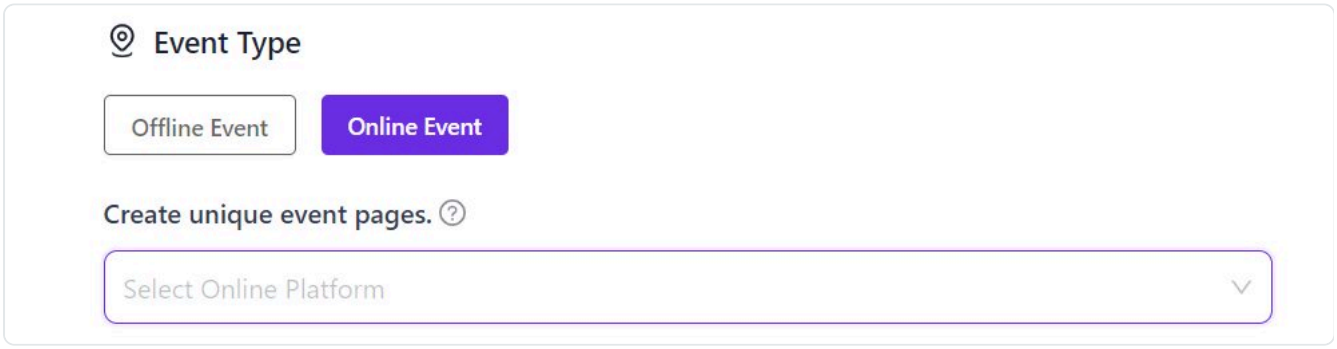

If it's an offline event, you will have to add the venue location, manually. If it's an online event, a new block will appear as per the needs.

Oh, and by the way, the autocomplete feature is also there in action.

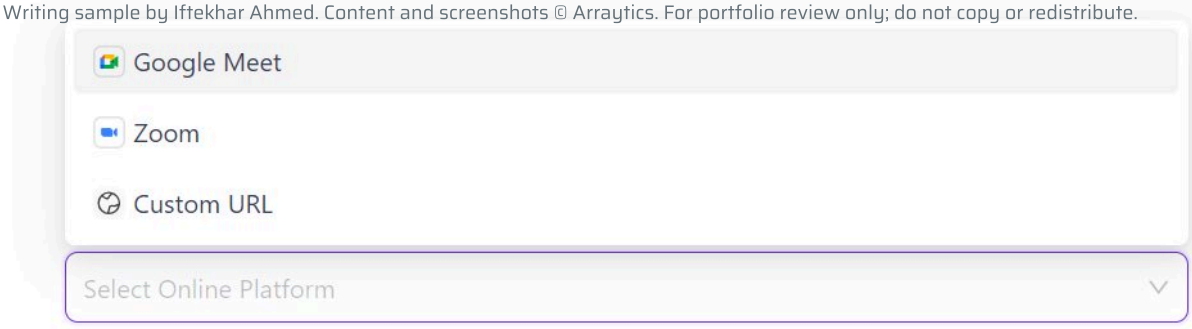

Custom URL to Add on Events

You might be bored with Google Meet or you might not like Zoom meeting or prefer any other video conferencing tool, for instance Sessions. In that case, old version dictated only the use of 2 video conferencing tools integrated with Eventin. Now, it's way different than before.

Now you can paste any custom URL or any other video conferencing link on the page to add on the event details, for the attendees to see.

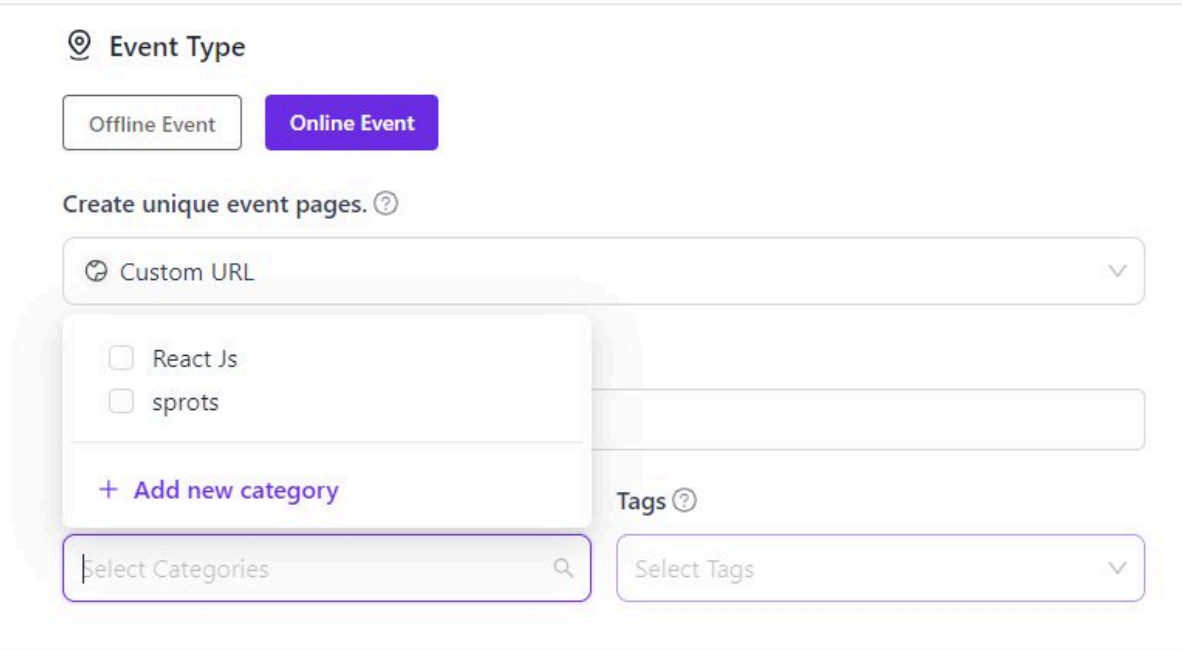

Writing sample by Iftekhar Ahmed. Content and screenshots © Arraytics. For portfolio review only; do not copy or redistribute.

New Style on Categories and tags

Now on Eventin 4.0 you can add categories and tags without the need to create them in a separate page.

Tags are important when it comes to organizing an event. So to make sure you never miss adding any tags on your events, we've brought the categories + tags section here right after the Custom URL option.

This way, you can select the tags from the list or create a new category/tags to make sure your event is well-organized and easy to find out.

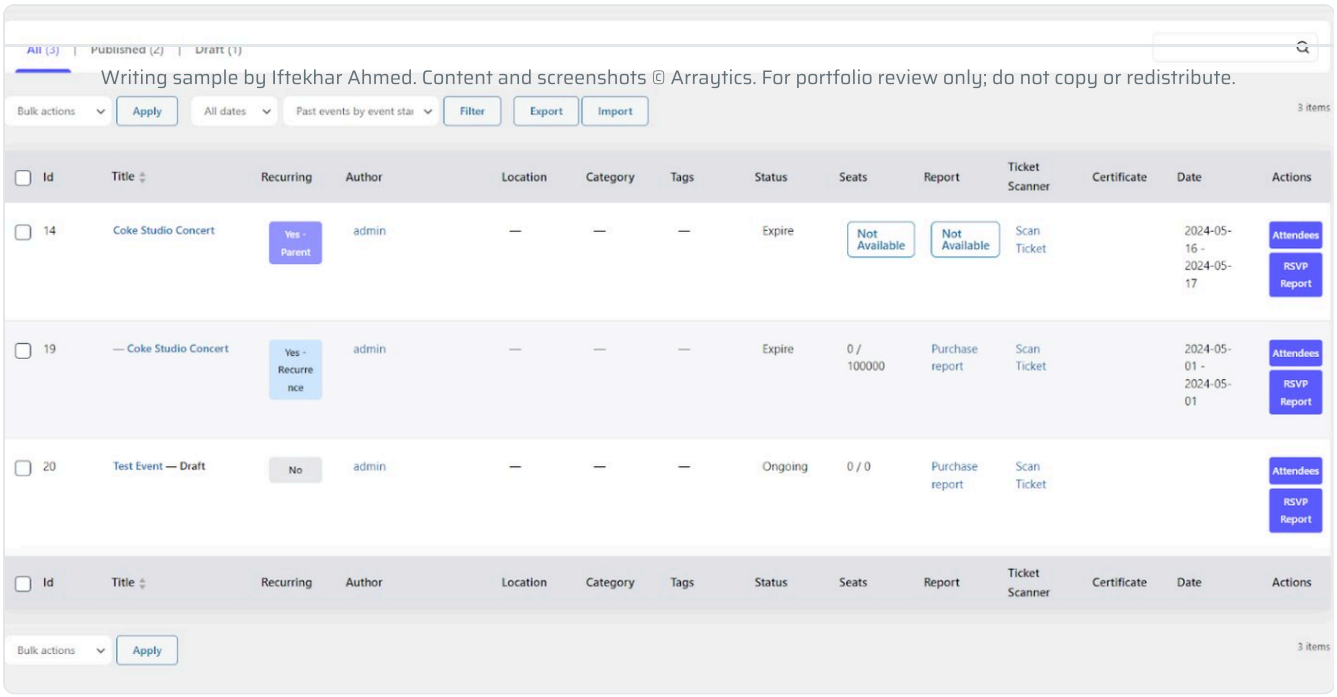

UX Update on Event List Page:

Now let's come to the Event List page where we'll show you the updates, we've done on user interface (UI) for your best experience.

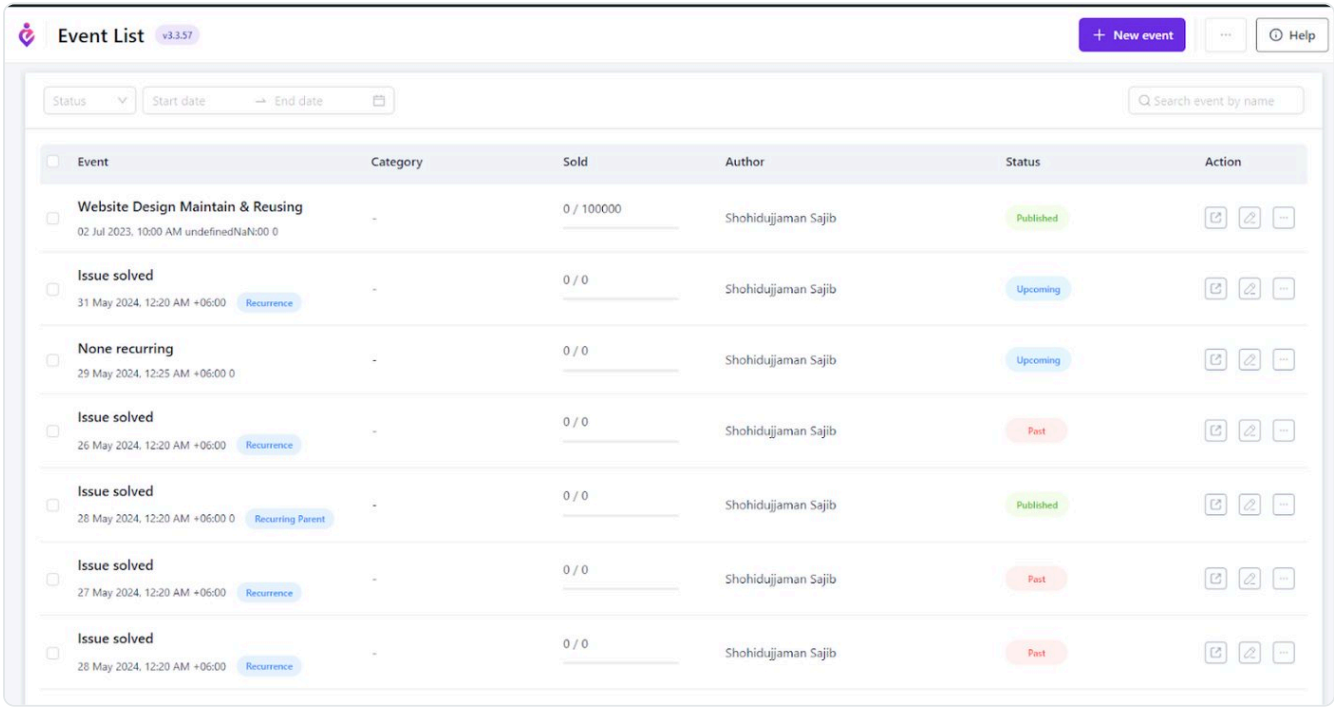

Event List Page UI Update

To cut the long beautiful story short, the previous version of event list looks classic, yet scattered and bland-looking in design.

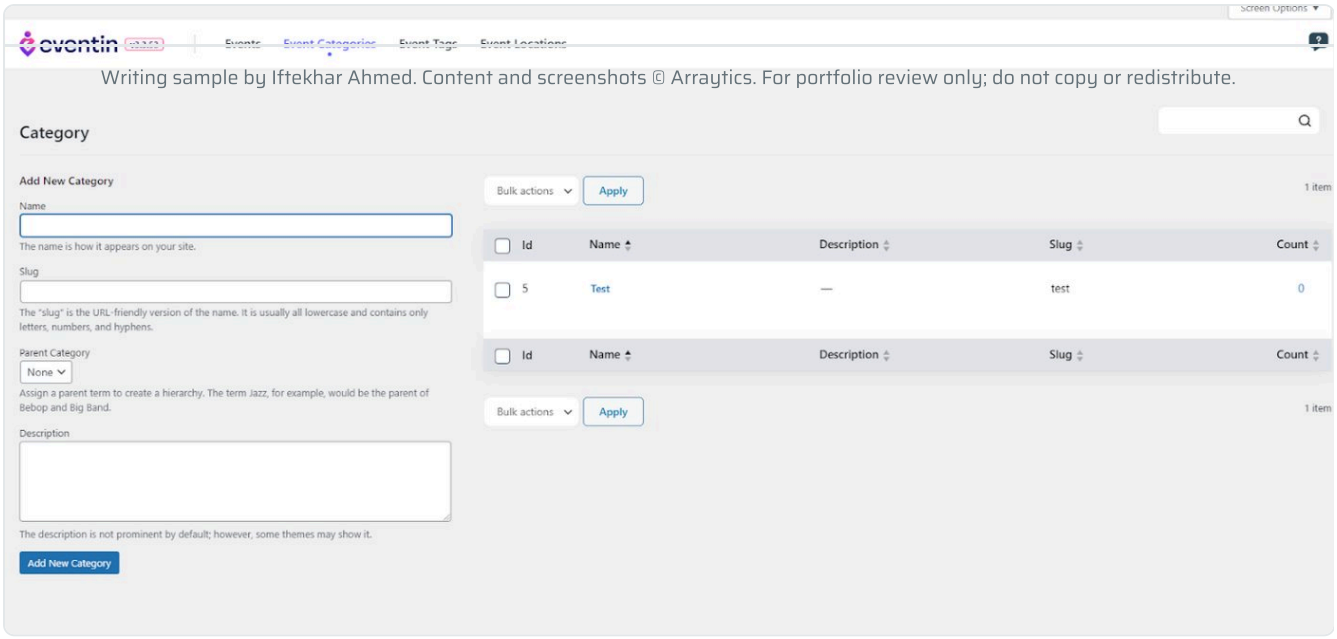

Writing sample by Iftekhar Ahmed. Content and screenshots © Arraytics. For portfolio review only; do not copy or redistribute.

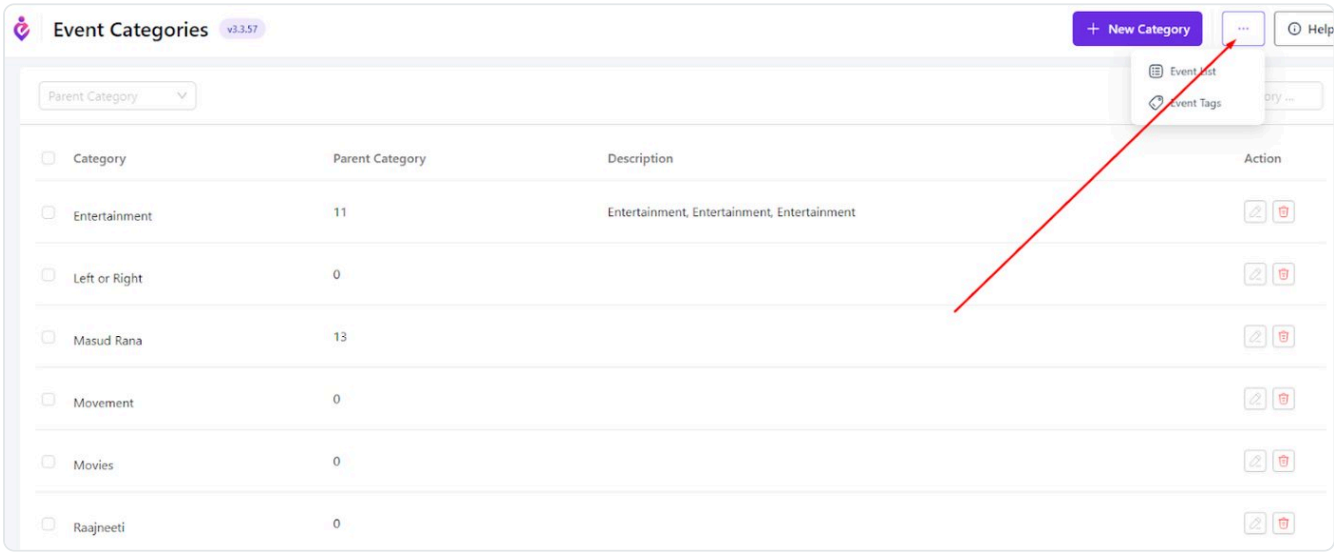

But the **listing page** on Eventin 4.0 is **much organized**, the event list page looks stunning in UX and the action sections are iconized instead of plain texts. The **author section** has been added on the listing page to show who's in charge of the events.

Even the category section is updated from top to bottom on Eventin 4.0. Here is what the category section looked like in the early 60s (just kidding):

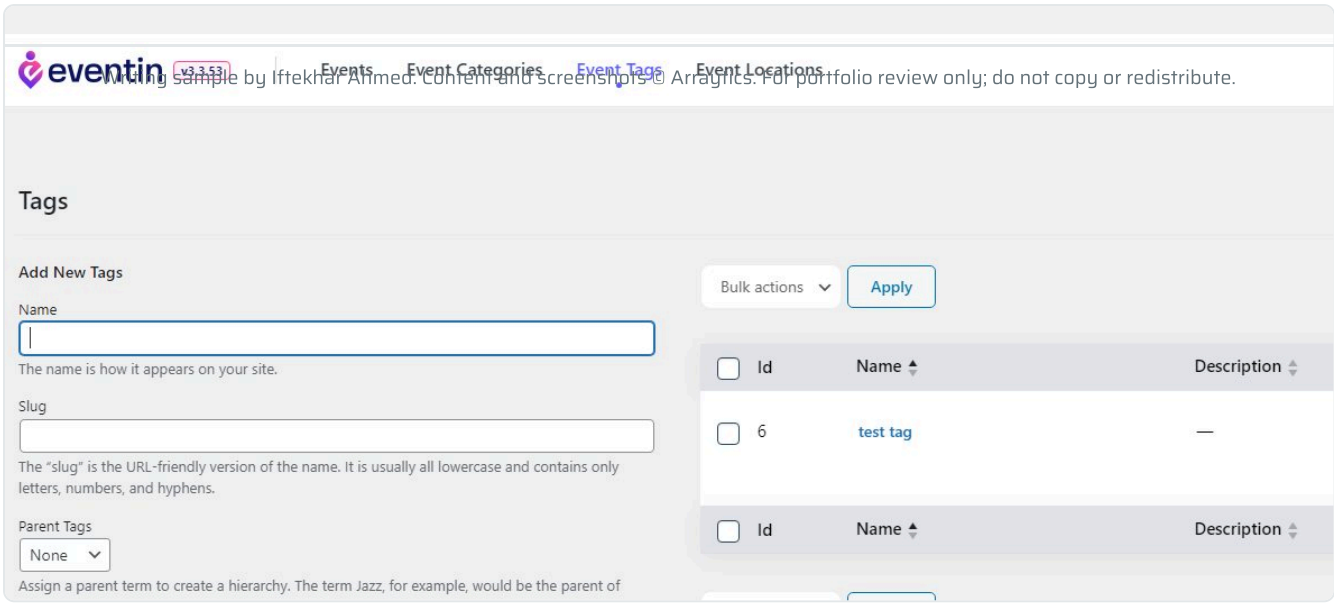

But now in Eventin 4.0, you can see the list of categories of different kinds of events you've organized before and see the descriptions to stay on track. From the event categories page, you can easily switch to event list in a click.

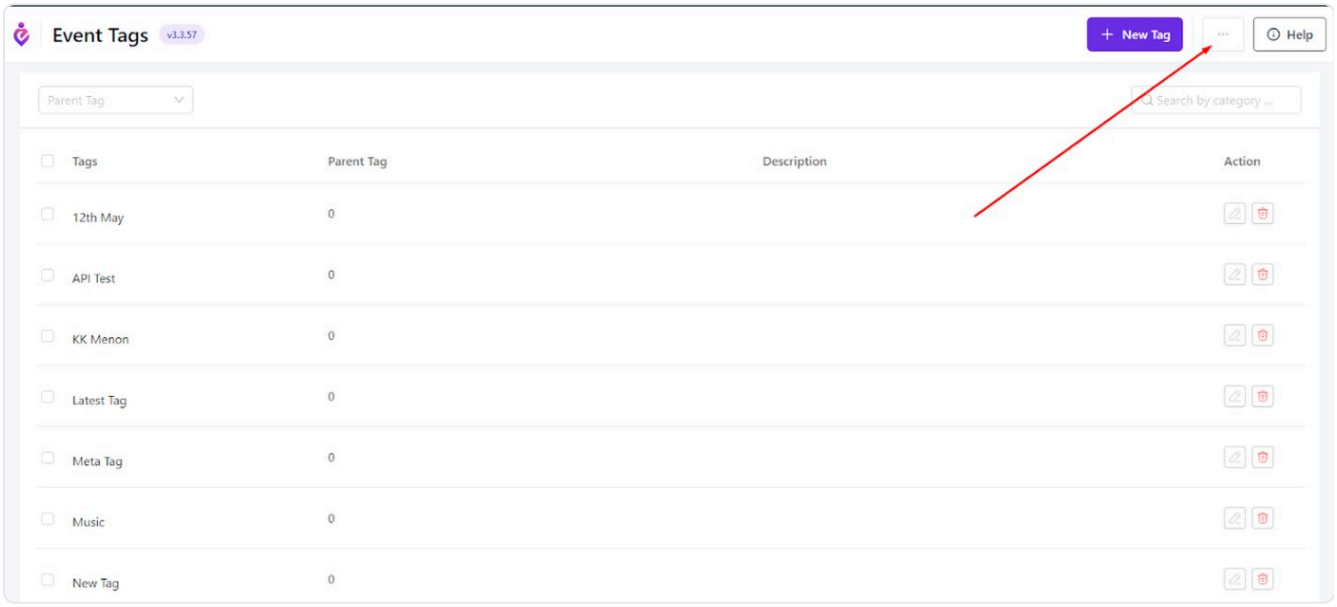

Improved Event Tag List Page

The same update that went for the categories page also **updated** the tag list section. Previously, you could only create a tag and see the list of it with small descriptions.

Writing sample by Iftekhar Ahmed. Content and screenshots © Arraytics. For portfolio review only; do not copy or redistribute.

Now on **Eventin 4.0**, you can see **the tags list**, **customize** them with the **parent tags**, add **descriptions** and take different **actions** on the page. It's much more updated, **easy-to-navigate** and more fun!

Code Block Improvements + Optimizations

Not just **UI/UX** or **making things look good**, Eventin 4.0 has arrived with better code optimization and improvements on different code blocks to make sure the **#1 WordPress event management plugin** works fine with better technical performance.

Optimizations on Eventin 4.0:

Eventin 4.0 has done major improvements & optimizations on different operations which was a headache before. Now that they are improved, the functionality to work them on the WordPress will be a more achievable experience. Here's a list of great optimizations you'll see on Eventin 4.0:

✨ Feature Enhancements:

Writing sample by Iftekhar Ahmed. Content and screenshots © Arrautics. For portfolio review only; do not copy or redistribute.

Improved support for Google Meet and Zoom Event Organizing. We have already optimized a few supportive steps along the way to make sure the event organizers can easily setup google meet or zoom link and add pre-populated meeting links within event details to create an event faster.

Unit Testing:

```
describe( 'Label', () => {
    let scope: HTMLElement;
    let child: HTMLElement;
    let icon: HTMLElement;
    let text = 'A quick brown fox jumps over the lazy dog';

    beforeEach( () => {
        render(
            <Label icon={ <EditIcon /> } sx={ { color: 'red' } }>
                <span data-testid="child">{ text }</span>
            </Label>
        );

        scope = screen.getByTestId( 'label' );
        child = screen.getByTestId( 'child' );
        icon = screen.getByTestId( 'mock-edit-icon' );
    } );

    it( 'should render the child text', () => {
        const childText = screen.getByText( text );
        expect( childText ).toBeInTheDocument();
    } );

    it( 'should render with child dom elements', () => {
        expect( scope ).toContainElement( child );
        expect( child ).toHaveTextContent( text );
    } );

    it( 'should render with icon', () => {
        expect( icon ).toBeInTheDocument();
    } );

    it( 'should take custom style as props', () => {
        expect( scope ).toHaveStyle( 'color: red' );
    } );
} );
```

You're seeing some test cases. Every block of code is now being tested, before we ship Eventin 4.0. So that the event users do not face errors & bugs in their business.

API Integrations:

Eventin 4.0 has significantly improved communication between different parts of the application through APIs (Application Programming Interfaces). That involves a smoother data flow between different modules like events, tickets, agendas etc. Not only that, the optimization on API integrations has made real-time updates across different sections of the platform. This increases the performance for a better functionality on API integrations as well as Eventin 4.0 opens the doors to potentials to integrate with more external services for additional functionalities.

Performance Improvements:

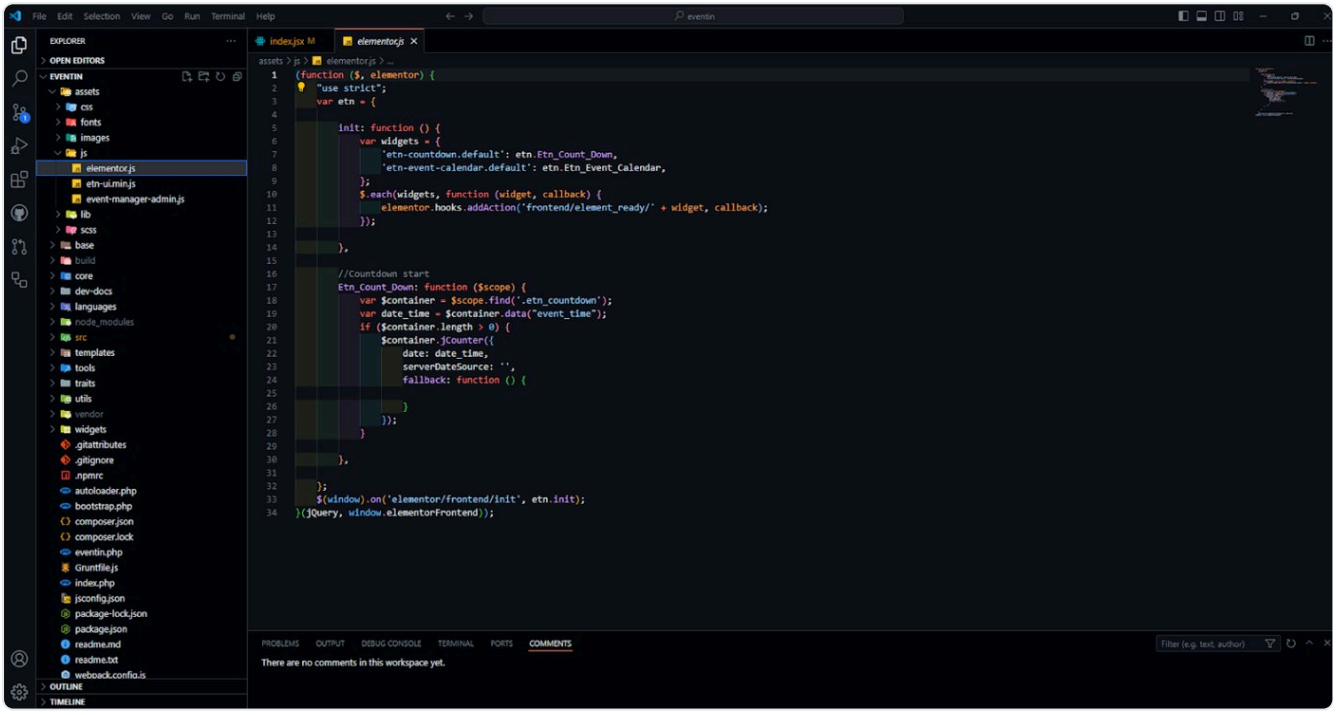

Eventin 4.0 has done a great deal on general code optimizations to improve the overall performance and efficiency of the entire application. The optimizations in the underlying codes will surely make the application run faster and efficiently.

Writing sample by Iftekhar Ahmed. Content and screenshots © Arraytics. For portfolio review only; do not copy or redistribute.

```
const handleOptionSearch = ( input, option ) => {
    return option?.label?.toLowerCase()?.includes( input?.toLowerCase() );
};

export default handleOptionSearch;
```

As you can see below, every small piece of code joined together. Making the code work fluently without any restriction.

So, you might experience:

✅ Quicker loading times for events and event details on frontend

✅ Improved responsiveness on the frontend platform (your WordPress website).

✅ A stable experience when working on the back-end.

▶ Data Caching for reduced network load

Eventin 4.0 has done Optimization for **Fetching data and caching**. We've used WordPress's **default data fetching and storing technology**, in order to optimize the **process and reduce the code size**. Just as shown, we're fetching the **settings** from the **backend**, which will be **cached**. And we're also re-validating the event list cache, depending on some logic.

One key optimization on Eventin 4.0 involves caching frequently accessed settings retrieved from the backend. This will make sure a swift retrieval on subsequent requests, giving you a faster user experience.

Writing sample by Ifekhar Ahmed. Content and screenshots © Arraytics. For portfolio review only. Do not copy or redistribute.

```
const applyWithSelect = withSelect( ( select ) => {
    const global = select( 'eventin/global' );
    return {
        settings: global.getSettings(),
        isSettingsLoading: global.isResolving( 'getSettings' ),
    };
} );
const applyWithDispatch = withDispatch( ( dispatch ) => {
    const global = dispatch( 'eventin/global' );
    return {
        refreshEventList: () => global.invalidateResolution( 'getEventList' ),
    };
} );

export default compose( [ applyWithSelect, applyWithDispatch ] )( Delete );
```

Even so, a sophisticated logic system governs the re-validation of the event list cache. This ensures data remains fresh while minimizing unnecessary database queries, further optimizing overall performance.

Enhanced Build Pipeline

Eventin 4.0, by definition has improved the process of pipelines automating the process of building and deploying the entire application. Eventin 4.0 has made sure to:

✅ Faster build times and deployment cycles.

✅ boosted consistency and reliability in the deployment process.

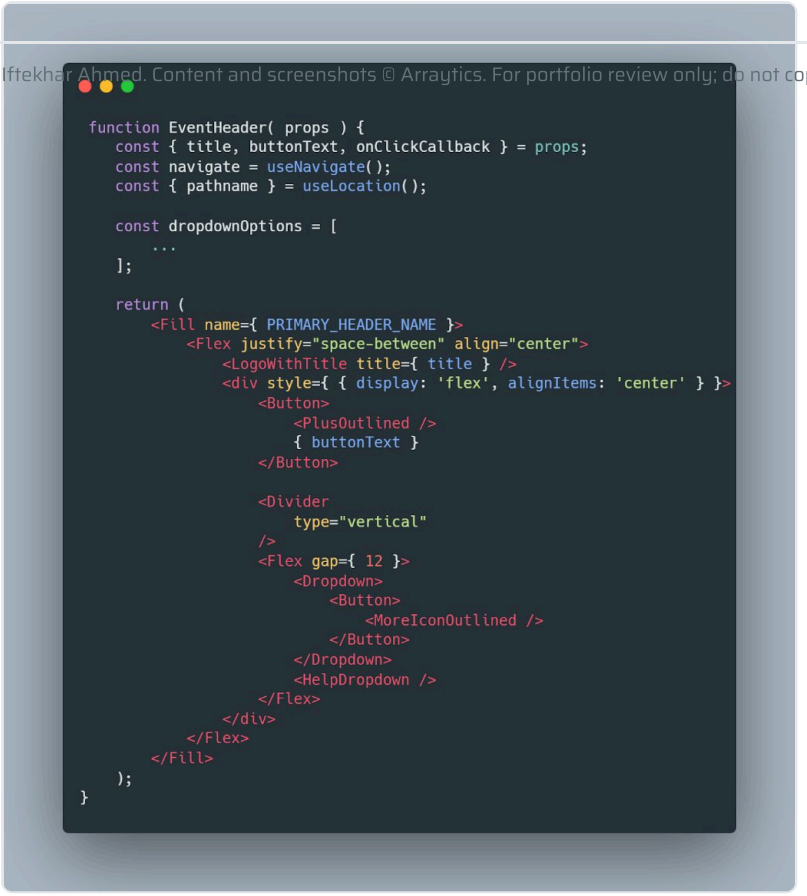

✅ Easier integration of new features and bug fixes.

In essence, this update delivers a leaner codebase that prioritizes efficient data management, ultimately resulting in a more responsive and enjoyable user experience.

Usage of React for Frontend for Dynamic Experience

After a while, Eventin 4.0 has made possible to build interactive and responsive user interface by using React for Frontend. Who wouldn't prefer a dynamic experience? This code below shows how **Event Header** is being created, in the easiest manner.

Writing sample by Iftekhar Ahmed. Content and screenshots © Arraytics. For portfolio review only; do not copy or redistribute.

```
function EventHeader( props ) {
    const { title, buttonText, onClickCallback } = props;
    const navigate = useNavigate();
    const { pathname } = useLocation();

    const dropdownOptions = [
        ...
    ];

    return (
        <Fill name={ PRIMARY_HEADER_NAME }>
            <Flex justify="space-between" align="center">
                <LogoWithTitle title={ title } />
                <div style={ { display: 'flex', alignItems: 'center' } }>
                    <Button>
                        <PlusOutlined />
                        { buttonText }
                    </Button>

                    <Divider
                        type="vertical"
                    />
                    <Flex gap={ 12 }>
                        <Dropdown>
                            <Button>
                                <MoreIconOutlined />
                            </Button>
                        </Dropdown>
                        <HelpDropdown />
                    </Flex>
                </div>
            </Flex>
        </Fill>
    );
}
```

The focus lies on implementing the DRY (Don't Repeat Yourself) principle, making sure the essential functionalities are well defined and utilized efficiently throughout the code. Additionally, we've embraced SOLID principles, a set of best practices that promote well-structured, maintainable, and scalable code.

By streamlining operations while following the established design principles, Eventin 4.0 aims to significantly reduce the potential for bugs and simplify future modifications.

Improved Filters to find events easily

The new version emphasized much on improving the filter options, to make sure the users can navigate throughout the plugin, and most of all, use filters to find events easier than before.

Writing sample by Iftekhar Ahmed. Content and screenshots © Arraytics. For portfolio review only; do not copy or redistribute.

```
const handleEventListFilter = () => {
        let filteredEventList = eventList;

        // Early exit if no filters applied
        if (
            ! status &&
            ( ! Array.isArray( dateRange ) ||
                ! ( dateRange[ 0 ] && dateRange[ 1 ] ) ) &&
            ! searchValue
        ) {
            setFilteredList( filteredEventList );
            return;
        }

        filteredEventList = filteredEventList.filter( ( event ) => {
            // Filter By Event Status
            if (
                status &&
                status !== 'all' &&
                event.status?.toLowerCase() !== status.toLowerCase()
            ) {
                return false;
            }

            // Filter by Date Range
            if (
                Array.isArray( dateRange ) &&
                dateRange[ 0 ] &&
                dateRange[ 1 ]
            ) {
                const startDate = dayjs( event.start_date );
                if (
                    ! startDate.isSameOrAfter( dayjs( dateRange[ 0 ] ) ) ||
                    ! startDate.isSameOrBefore( dayjs( dateRange[ 1 ] ) )
                ) {
                    return false;
                }
            }

            // Search the Event List
            if (
                searchValue &&
                ! event.title
                    .toLowerCase()
                    .includes( searchValue.toLowerCase() )
            ) {
                return false;
            }

            return true;
        } );

        setFilteredList( filteredEventList );
    };
```

This glimpse of code shows the process to filter event list by status, filter by date range with a constant of start date of the event and attempts on the search the event list.

This emphasis on organization translates to a more reliable codebase with fewer errors. It also empowers developers to navigate, understand, and modify the code with greater ease, fostering a smoother development process and faster innovation.

Bug Fixes & Resolutions on Eventin 4.0:

Other than code optimizations & improvements, Eventin 4.0 has made fixes on major bugs that have been “bugging” event users for a while. At last, as a new beacon of new way, Eventin 4.0 gives a few resolutions that you need to see:

Bug Resolutions:

We have been committed to providing a great user experience for every event organizer out there. This resolution on bugs tackles previously identified issues related to **modals, layouts, and child event displays**.

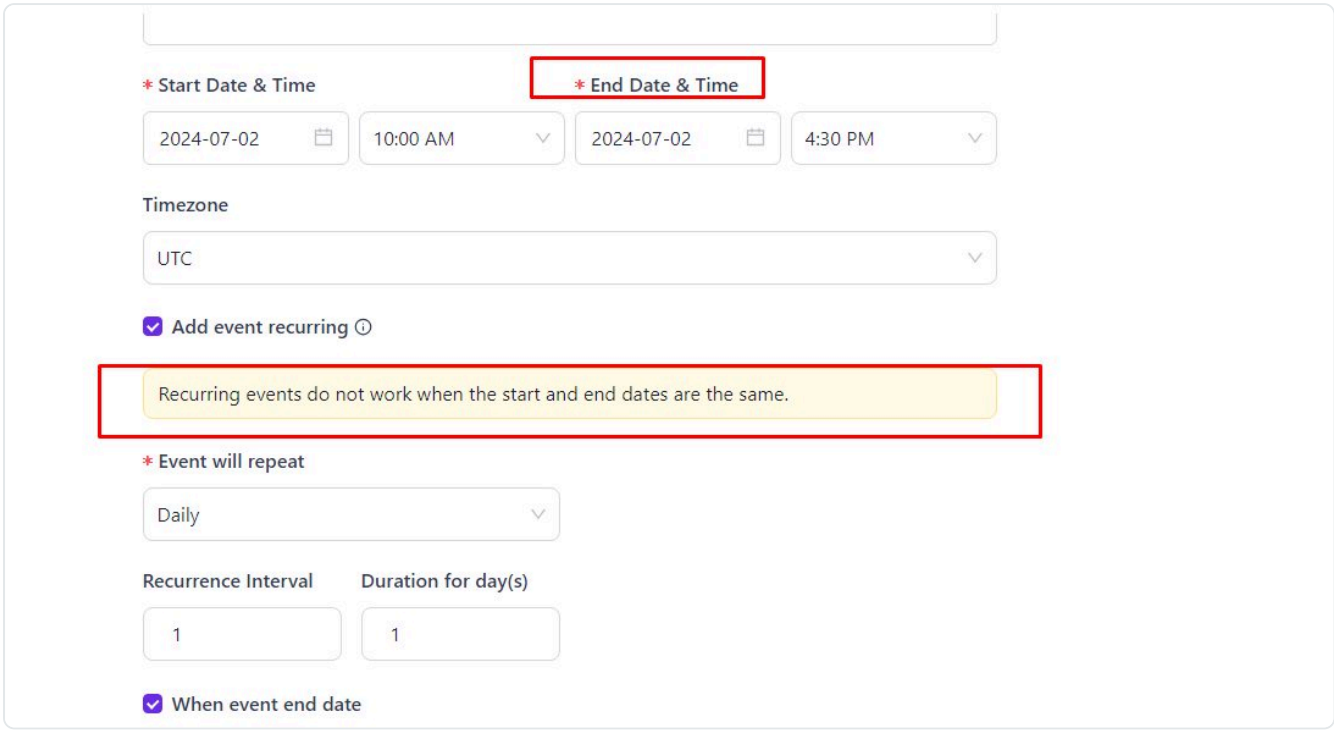

We did our best to make sure these resolutions bring smooth interactions, improved visual presentation, and a more intuitive platform for all users.

Form and Field Validations:

Data accuracy is very important.

This update by Eventin 4.0 strengthens data integrity by making sure that required or crucial fields cannot be bypassed during data entry. For example, when creating recurring events, specifying an end date is now mandatory.

This approach will surely eliminate the possibility of incomplete or inaccurate data collection during events, which will ultimately improve the authenticity of the information stored on Eventin 4.0.

Notification Updates:

Introducing a notification system on this update that delivers success or error messages based on your actions.

This update by Eventin 4.0 is crucial to your actions during creating and managing events.

These clear notifications will give you valuable feedback on the outcome of your interactions within the platform.

Style and Layout Fixes:

We're constantly striving to refine the user experience. This update addresses inconsistencies and layout issues within the user interface (UI), resulting in a more polished and visually harmonious platform.

Imagine a well-designed room; everything is placed intuitively and adheres to a consistent style. This update aspires to achieve the same for the user interface. By ironing out inconsistencies and refining layouts, we're creating a more aesthetically pleasing and user-friendly environment for interacting with the platform.

Recap: List of Significant UX Improvements on Eventin 4.0

So, the Eventin 4.0 is here to make event management great again, and easier than before.

Apart from the changes, the new features we have brought and the existing features we've optimized will surely bring about a more improved user experience for the event organizers.

So here is the list of the significant UX improvements we've done on Eventin 4.0:

Create an event in seconds!

Thanks to the all-new user interface (UI), you can create an event in a few clicks with the right components in one place (event creation page).

Event Banner Image:

Now enjoy the event banner image and event logo on the same **event creation page**, with all the right components you need to make the work easier.

Recurring Event

Simply enable the **event recurrence** on the **event creation page** easily and select the mandatory dates for the recurrence to end.

Improved Location Field

Experience a "much better" location field to define the nature of your event (**online/offline**) and the location venue will appear accordingly, with a meeting link or **custom URL for online events** and an **autosuggested venue location** for offline events.

Custom URL Support for Online Events

Put a custom URL on the event details to connect with your event attendees, apart from Google Meet and Zoom link.

Create Speaker/Organizer Groups

Create speakers & organizers profiles in groups, and select them while creating an event, or select the groups for different sessions without leaving the editing page.

Customizable Ticket Sale Timing

Add start & end dates to your ready-to-buy Sales Tickets, so you can start selling before the event, or sell them like an early bird seat for the events.

Action-Packed Tickets & Landing Page Templates

Pre-build ticket templates to start selling fast during the events, while using the event landing page template will make it easy to create an event faster, and the eye-catchy certificate templates ready to award to the attendees, to the spice up the entire event.

Improved Workflow for Categories, Tags, and Speakers
